Simulation Workflow

Predeformation / Compensation

Simulation Workflow

SIEMENS
Ingenuity for Life

- Build Preparation is done on in the Additive Manufacturing Module of NX
- Simulation is fully integrated into the AM Workflow
- Position, Build Space, Support structures are reused for Simulation

Simulation Workflow

Thermal and Mechanical Model

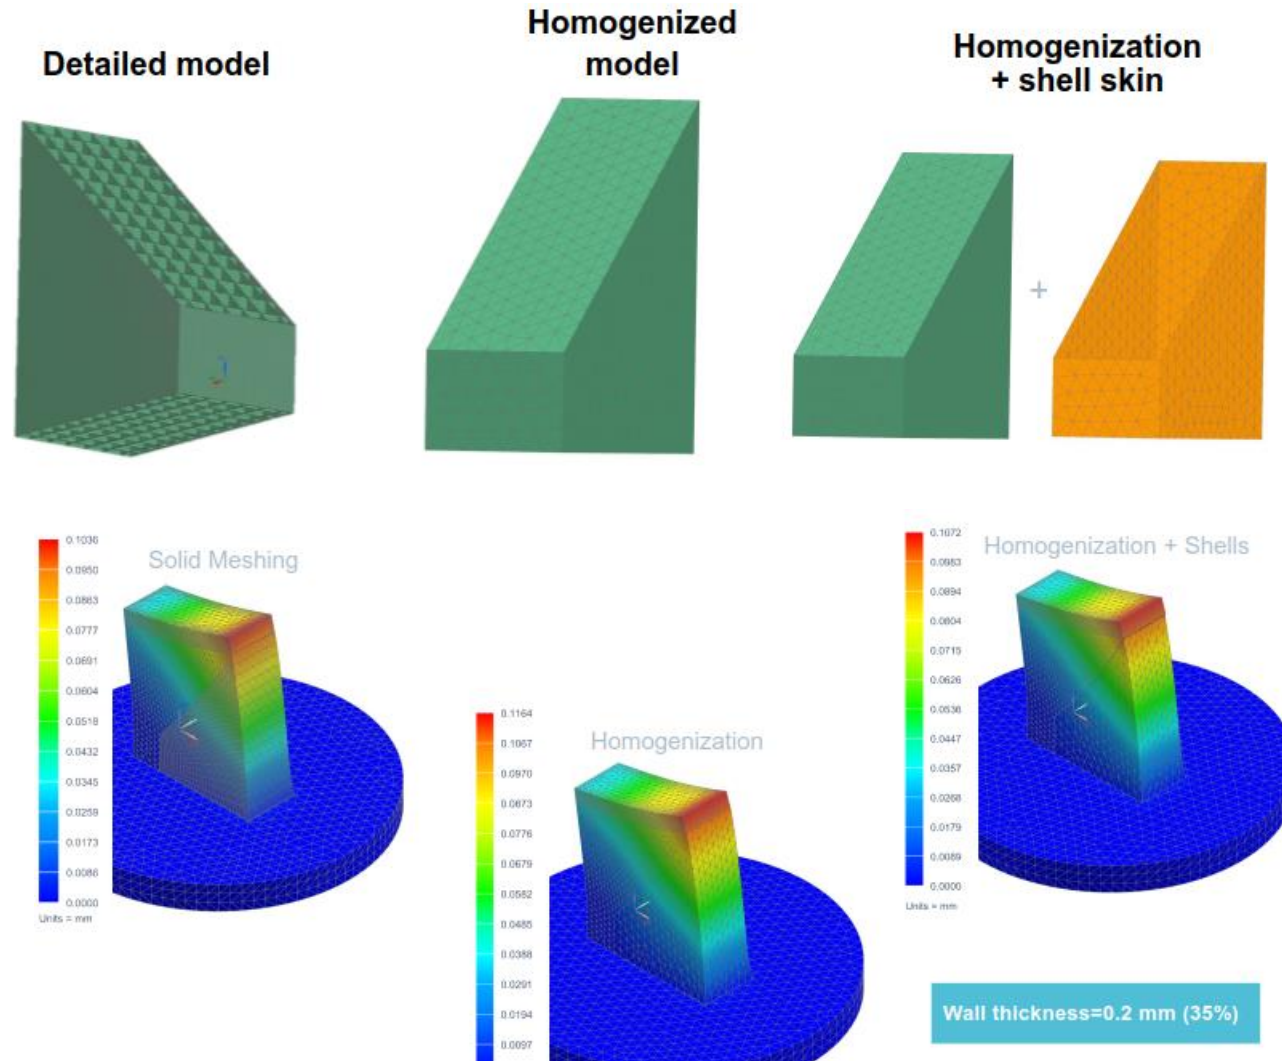

- Separate Meshes for Thermal and Mechanical Analysis
- Exact Meshing of the Geometry

Simcenter 3D Additive Manufacturing Support homogenization

- Virtual Materials Characterization (VMC) to homogenize support structure
- Integrated in Simcenter 3D AM
- Possibility to implement homogenized values manually

Simcenter 3D Additive Manufacturing Meshing and Layer Slicing

Meshing

- Simcenter 3D meshing capabilities is used to generate high fidelity 3D Meshes
- Detailed meshing allows to consider geometric details like cooling channels

Slicing

- Powerful Slicing algorithms for building the layer based models
 - Mesh based slicing for thermal analysis
 - Solver based slicing allows to realize 1mm super layers for Simulation of the mechanical distortion

SIEMENS
Ingenuity for life

Simulation Workflow

SIEMENS
Ingenuity for life

- Full Thermo Mechanical Analysis
- Non-linear Solution

Thermal and Mechanical Results

Powder Bed Fusion Process Simulation

Simcenter 3D Additive Manufacturing

Goal:

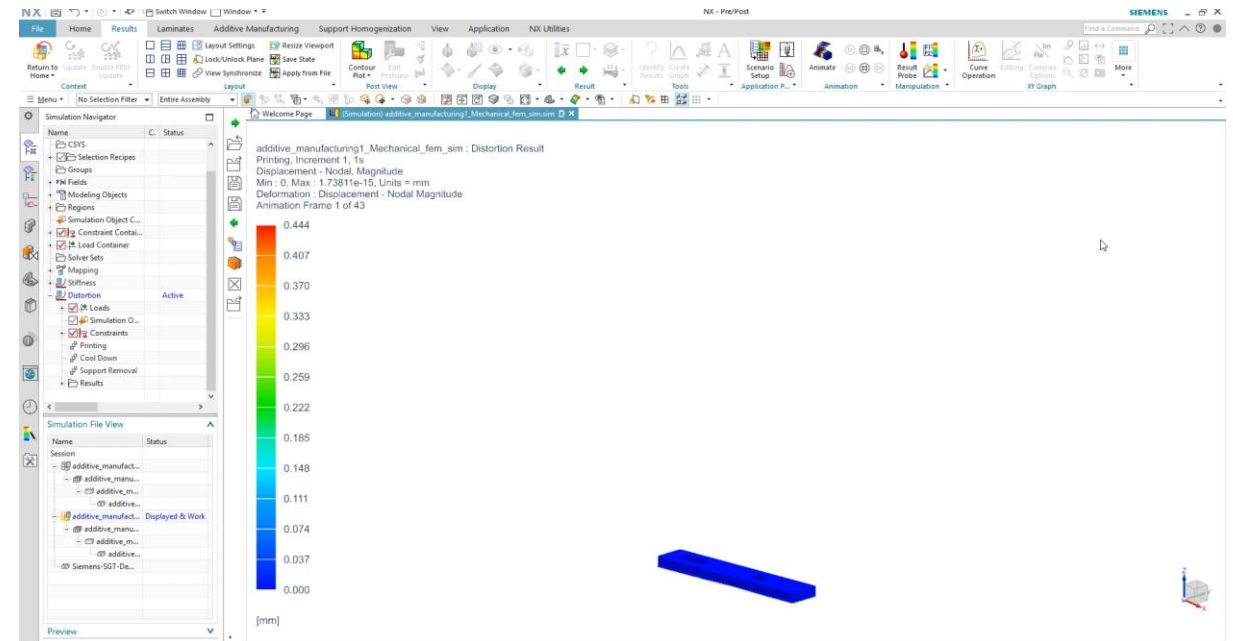

- Enable feedback of SLM process outcome to Process Engineer and CAD designer

Avoid:

- Too high distortion after manufacturing
- Global & local over-heating

Challenge:

- Producing a part sized around 100mm requires
 - ~ 3000 slices
 - ~ 10-20 hours of production time
 - ~ 5 millions of exposure vectors (5mm each)
 - ~ 25 km of “tool path”
- **Extreme spread of time- and length scales**

Simcenter 3D Additive Manufacturing Macro-scale Mechanical Model

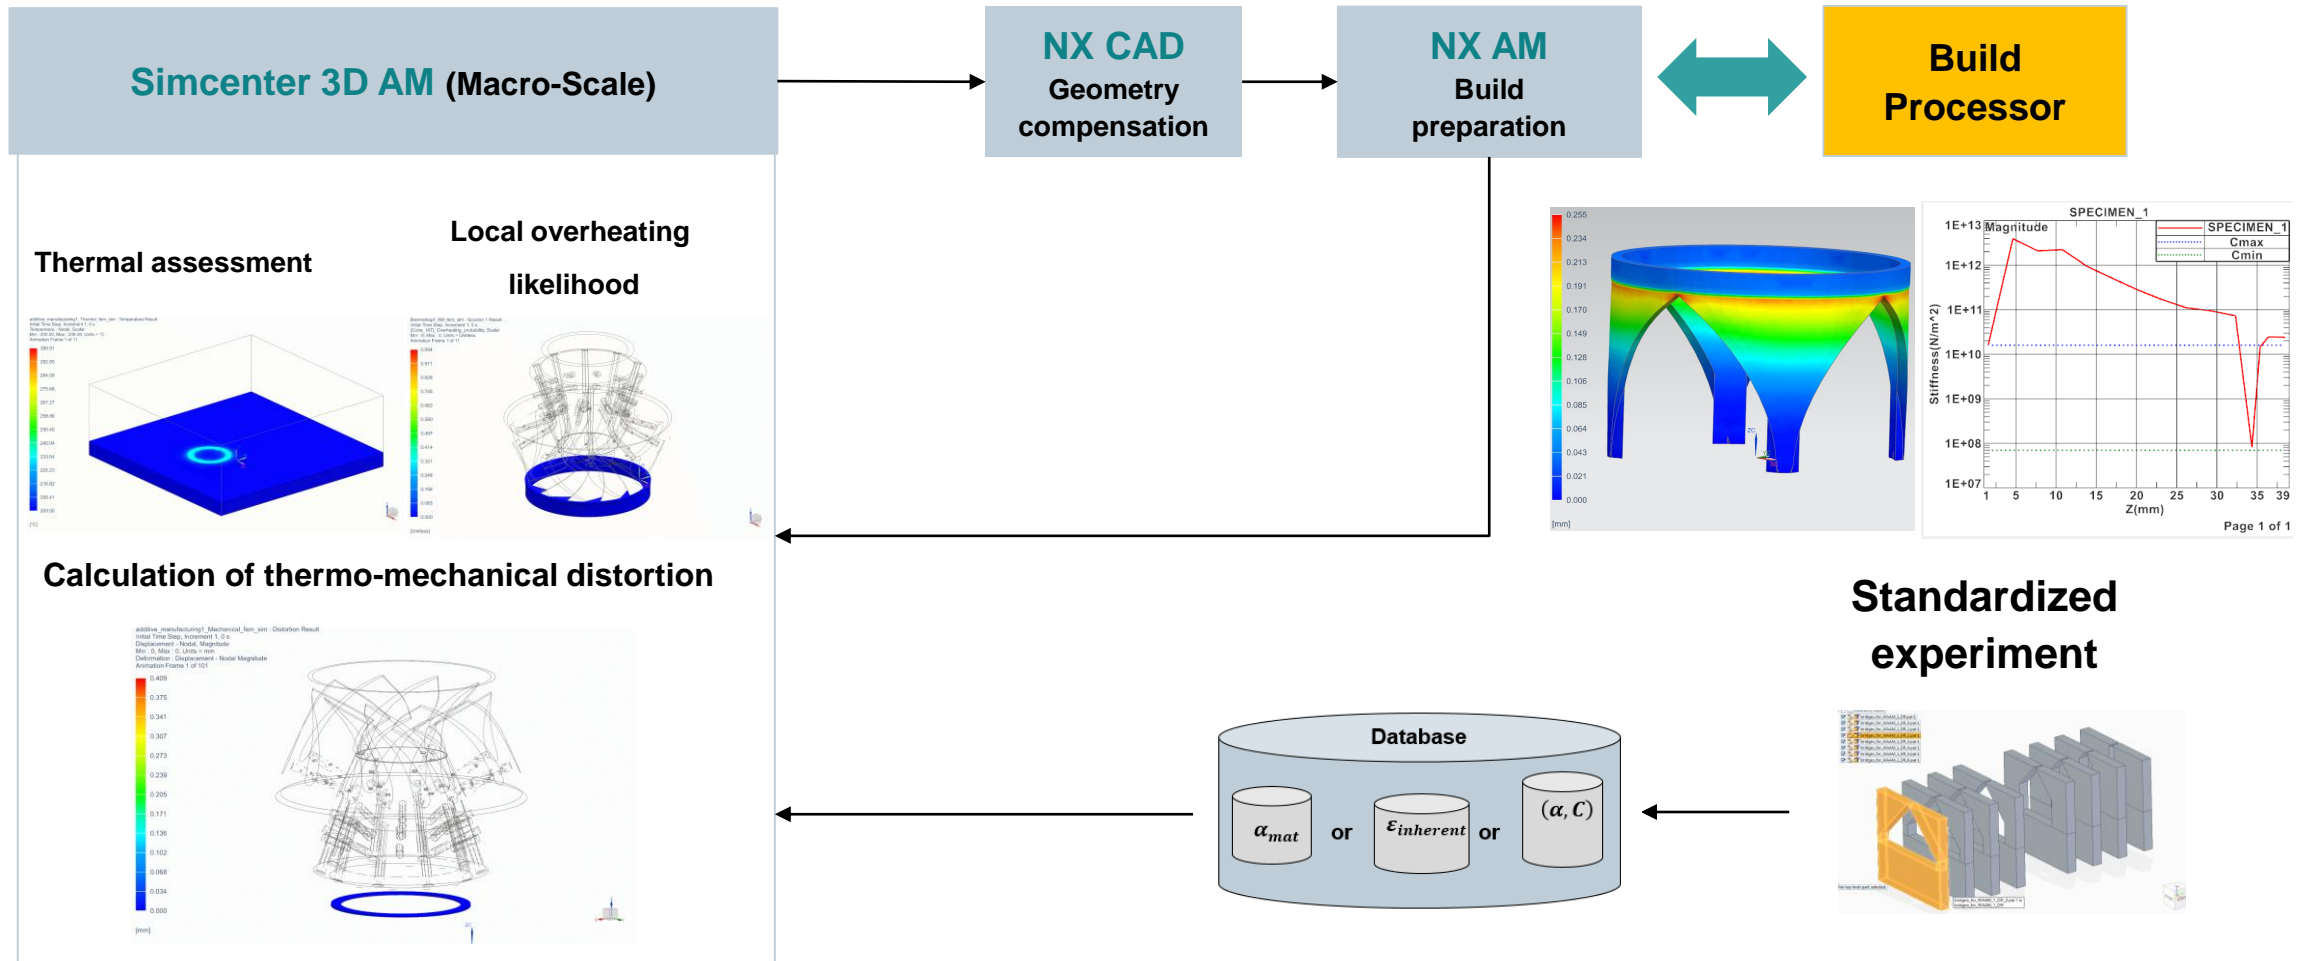

- Simulate thermal shrinkage of **whole layers** instead of single tracks
- z-step 500µm-1mm instead of 30-50µm (super-layers w/ effective material parameters)
- effective super-layer parameters must be extracted from meso scale simulations (or from experiments)
- Whole-part simulation possible
- Unique Siemens Feature: enhanced inherent strain model.

Effective layer Shrinkage Parameter must be a function of the stiffness

- calibration: Build und measure bridges of extract effective shrinkage

Simcenter 3D Additive Manufacturing Simulation Architecture

Simcenter 3D Additive Manufacturing

Local overheating

- Local overheating visualized layer by layer in 2D
- Possibility to have a 3D vision on the local overheating
- Part of the thermal analysis and short computational time

AM_Blade_EndToEnd_Thermal_fem_sim : Temperature Result
Interpolation, Increment 5, 5 s
{Code_167}_Overheating_probability - Nodal, Scalar
Min : 0.000, Max : 0.987, Units = Unitless

[Unitless]

DPP_Vane_asp_f1_sim1 : Solution 1 Result
Slice 1, Increment 0.2 s
{Code_167}_Overheating_probability - Scalar
Min : 0.000, Max : 0.995, Units = Unitless

[Unitless]

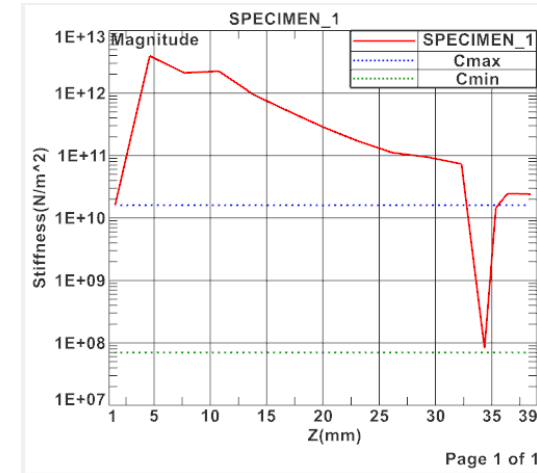

Simcenter 3D Additive Manufacturing

Stiffness calculation – shrink lines

- Stiffness analysis layer by layer to identify the areas of potential severe distortions or shrink defects
- 2D curve with layer stiffness information

Build process simulation ensures jobs print First-Time-Right

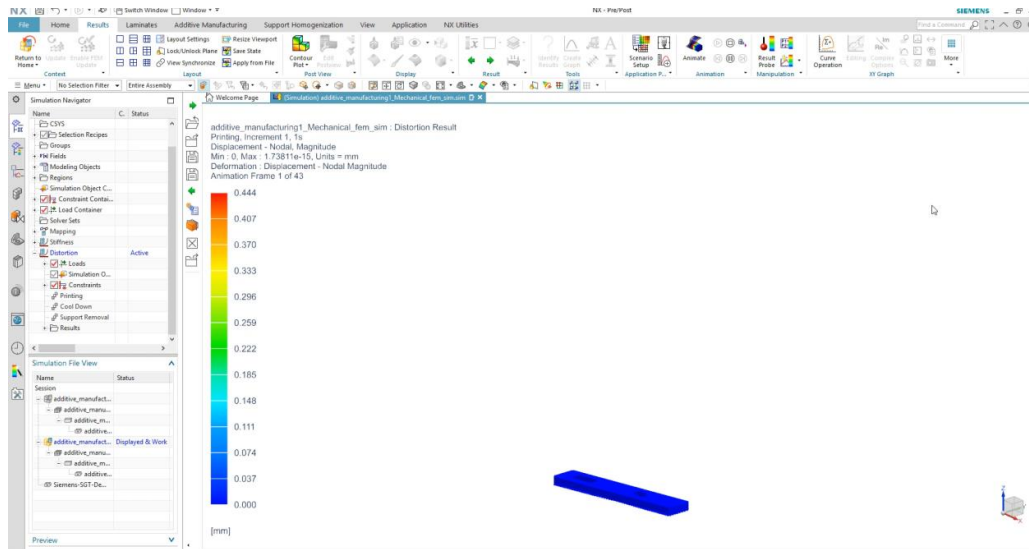

Virtual detection and elimination of distortion, overheating and other defects with build process simulation leading from “try and see” to First-Time-Right.

Simcenter 3D Additive Manufacturing Additive Manufacturing Process Simulation

SIEMENS
Ingenuity for life

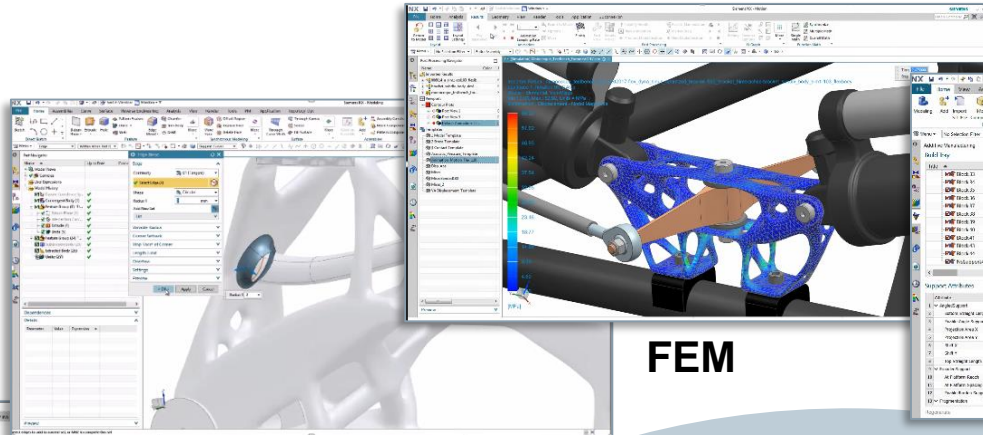

- New Simcenter 3D Product to analyse the 3D printing process for Powder Bed Fusion.
- Seamlessly integrated with NX Additive Manufacturing
- Open architecture and physics based modeling
- Digital twin of production to simulate:
 - Temperature with and without powder
 - Probability of overheating
 - Distortion before support, after heat treatment as build
 - Compensation workflow
 - Prediction of shrink lines
 - Recoater interference
 - Stiffness calculation
