

**Vehicle system integration
guidelines for component suppliers**

Introduction

Automotive industry trends and needs

of vehicle variants

- Increasing testing effort
- Prototype availability?
- Impact of modification?
- ...

Throughout the development

Need vehicle-level
component
evaluation

How to ensure system performance while keeping development time and cost under control?

Introduction

Challenges for suppliers

More pressure from OEM to **work on integration**

- How to evaluate component behavior at full vehicle level?
- How to cascade targets from full vehicle to component?
- How to solve vehicle integration issues earlier?

How to keep control of the NVH Performance at any stage of the development cycle?

SIEMENS
Ingenuity for life

Can we provide methods that addresses all these challenges?

Electrification

of variants

No proto's

Global use of components

Platform strategy

YES, WE CAN!

Content

Full vehicle testing
and TPA

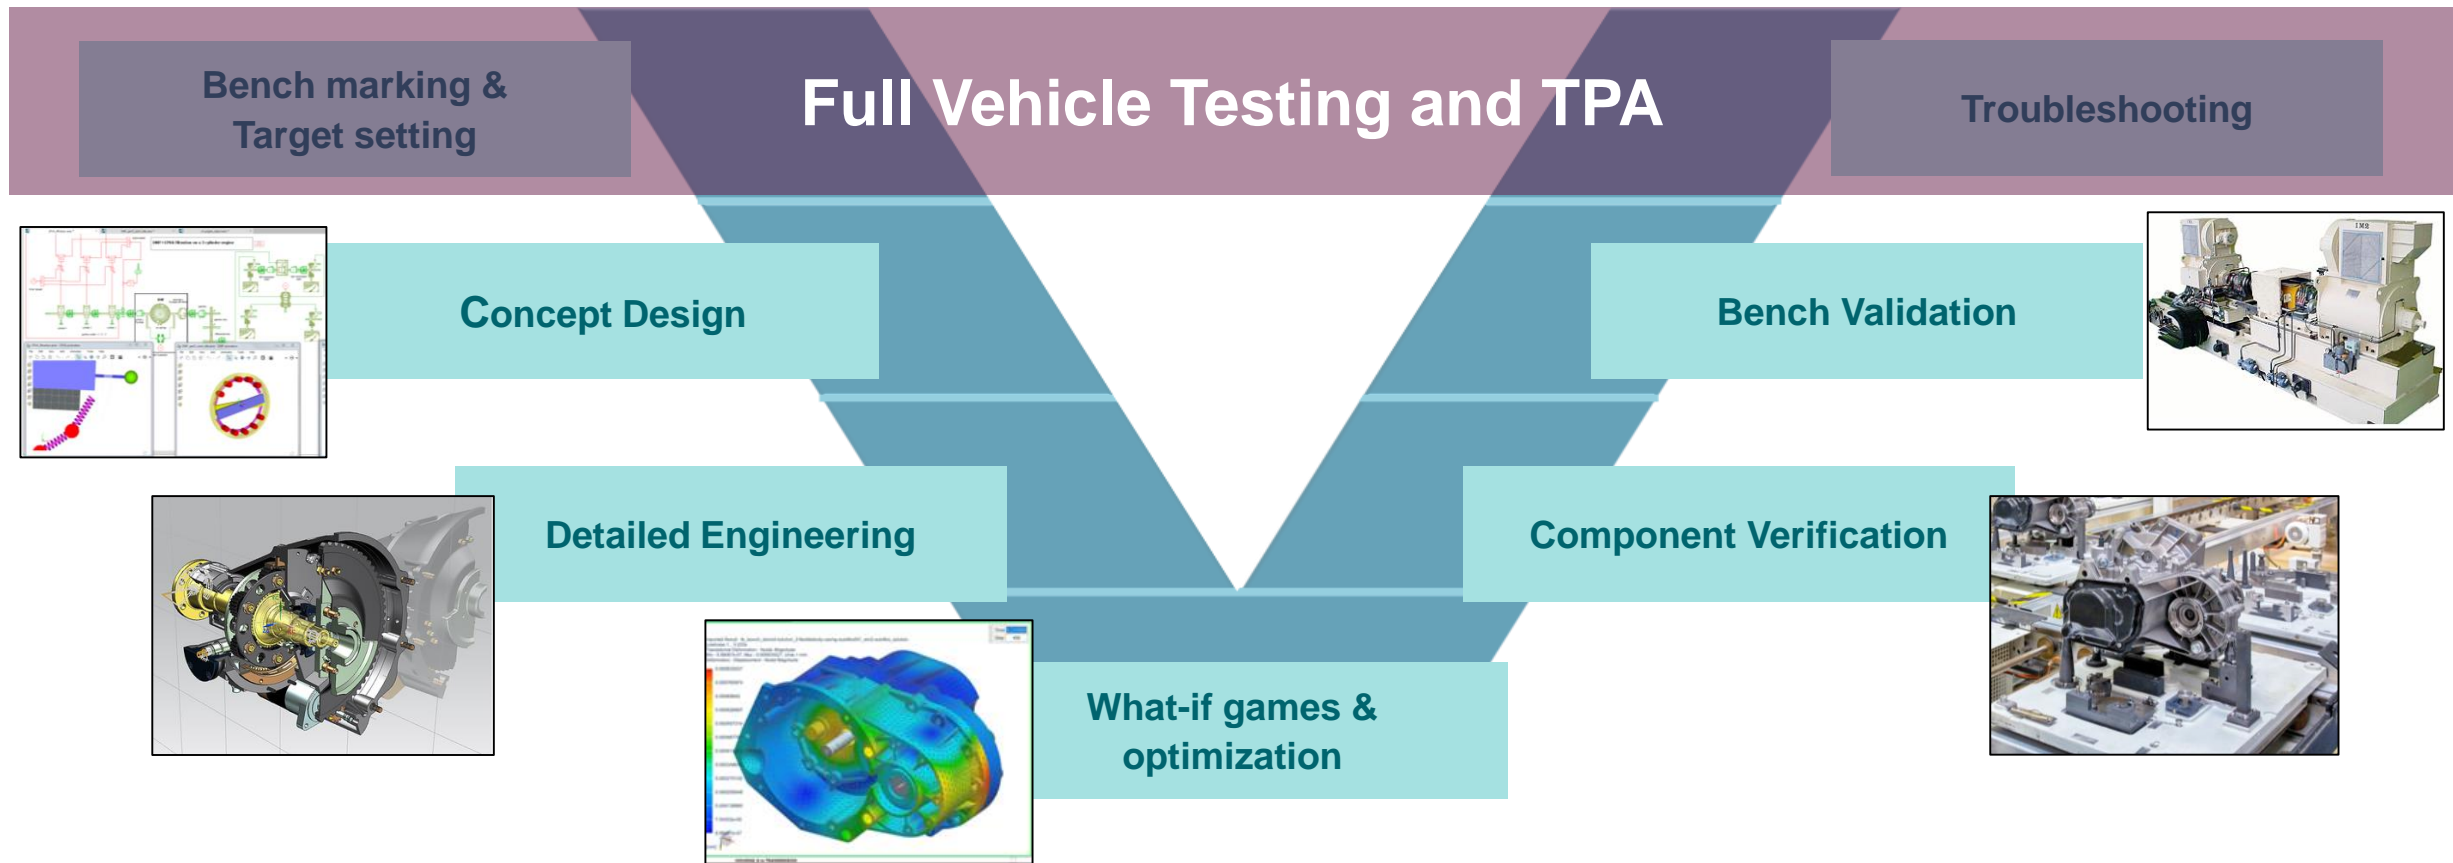

Component-based
TPA

Model-based
development

Model-based system
testing

Ensure vehicle-level component NVH evaluation Throughout the development cycle

Full vehicle testing and TPA

Testing the component in full vehicle

Driving Condition:

How the vehicle is controlled by the driver

Operating Condition

How the vehicle reacts to the driver input (vehicle status)

Sub-system Behavior

How the subsystem behaves in that operation

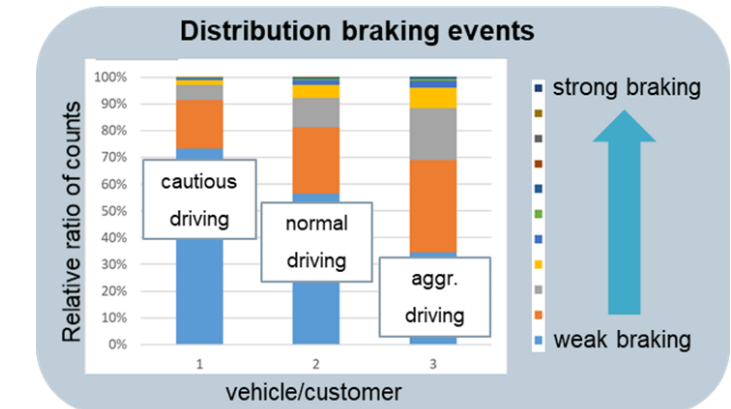

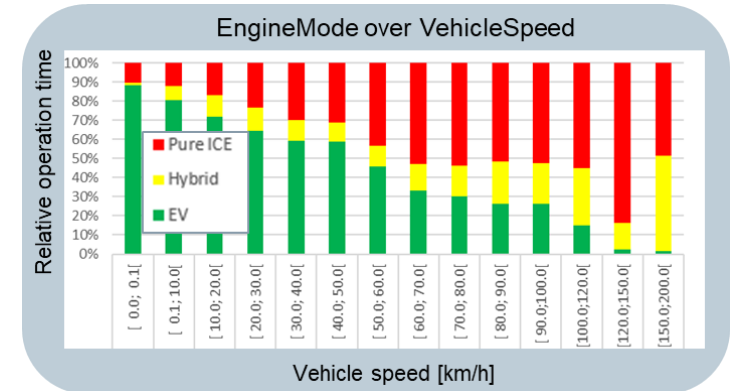

Subjective perception

How the driver perceives the vehicle response

Many potential test scenarios:

- Vehicle Variants
- Markets
- Operating modes (SoC, torque, rpm, temperature, ...)

Full vehicle testing and TPA

Transfer Path Analysis

Transmission

Drive line

Cascade Targets

Receiver (y_k)

Full vehicle testing and TPA

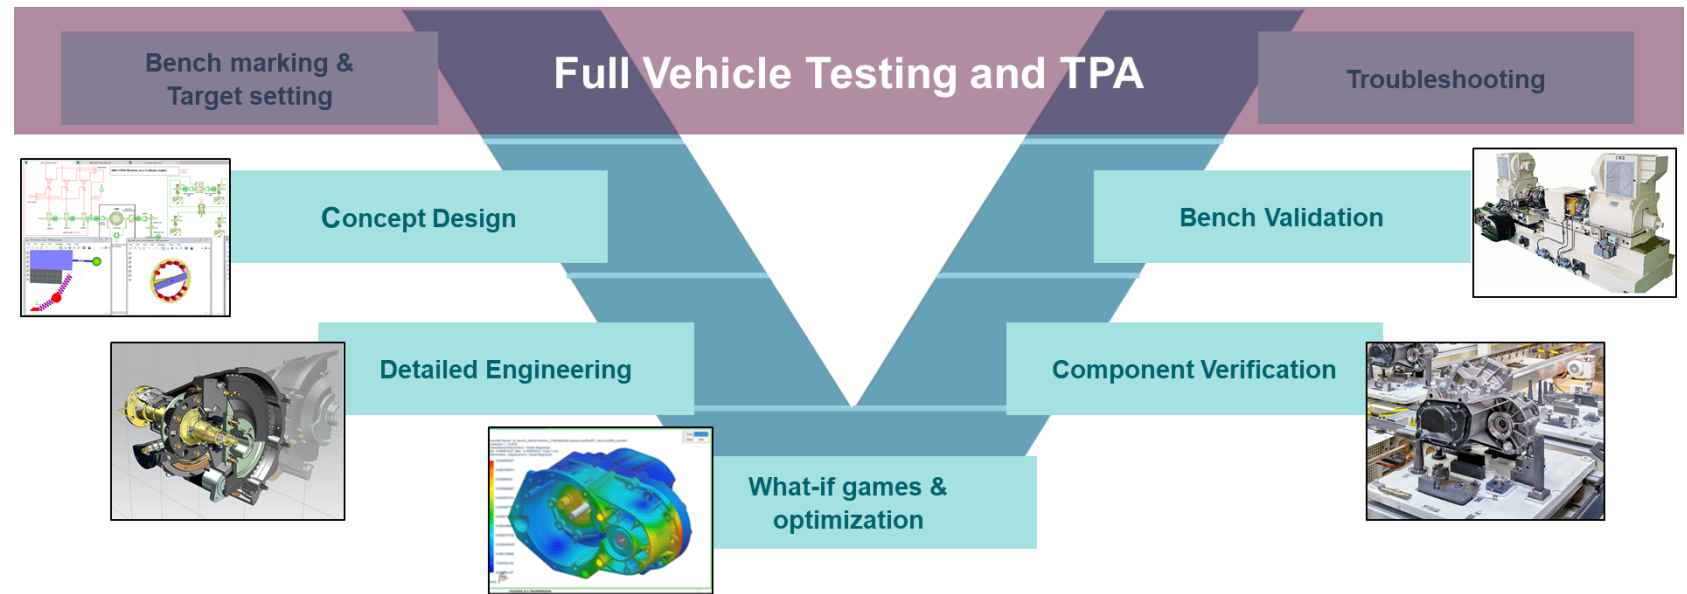

Transfer Path Analysis – HVAC TPA

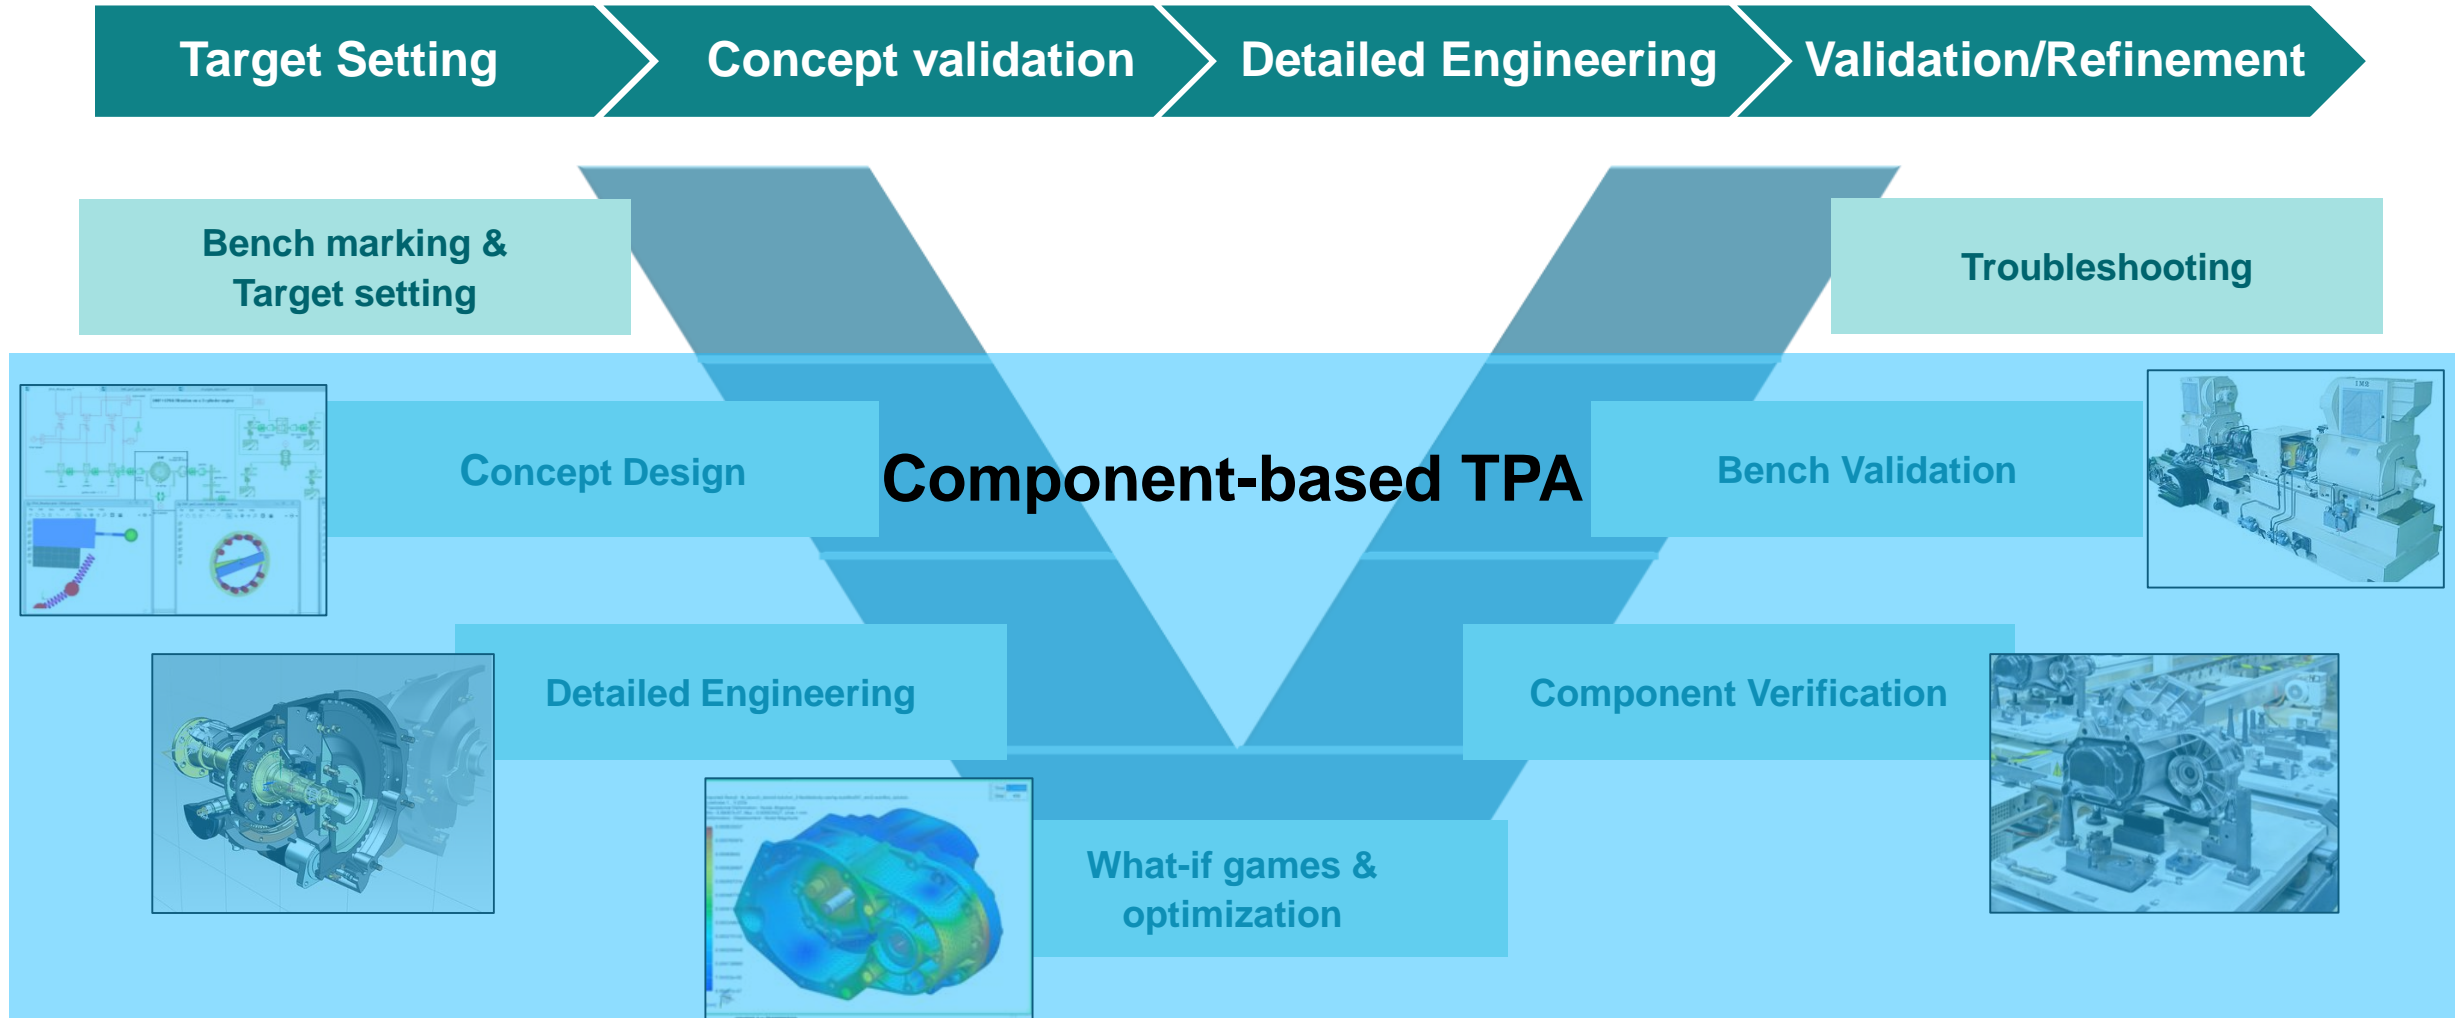

Full vehicle testing and TPA

Evaluate the sub-system
in full vehicle

Cascade targets from
system to components

Ensure vehicle-level component NVH evaluation Throughout the development cycle

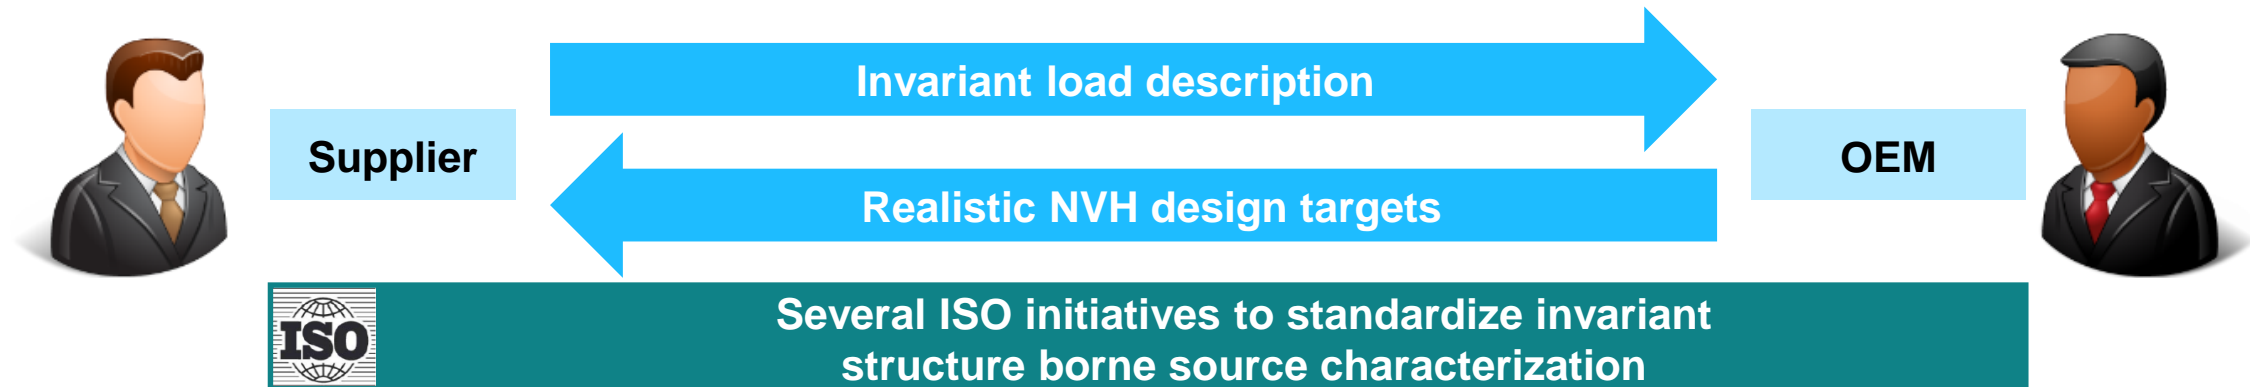

Component-based TPA

Improving OEM – Supplier cooperation

shorter design cycles / reduced prototype availability / more variants / frontloading of engineering / ...

Component based TPA

Speeding up the development cycle by combining testing and simulation

SIEMENS
Ingenuity for life

identify key components likely to contribute to noise and vibration issues

isolate components for high quality test bench data collection and independent load characterisation

Component based TPA

Speeding up the development cycle by combining testing and simulation

identify key components likely to contribute to noise and vibration issues

isolate components for high quality test bench data collection and independent load characterisation

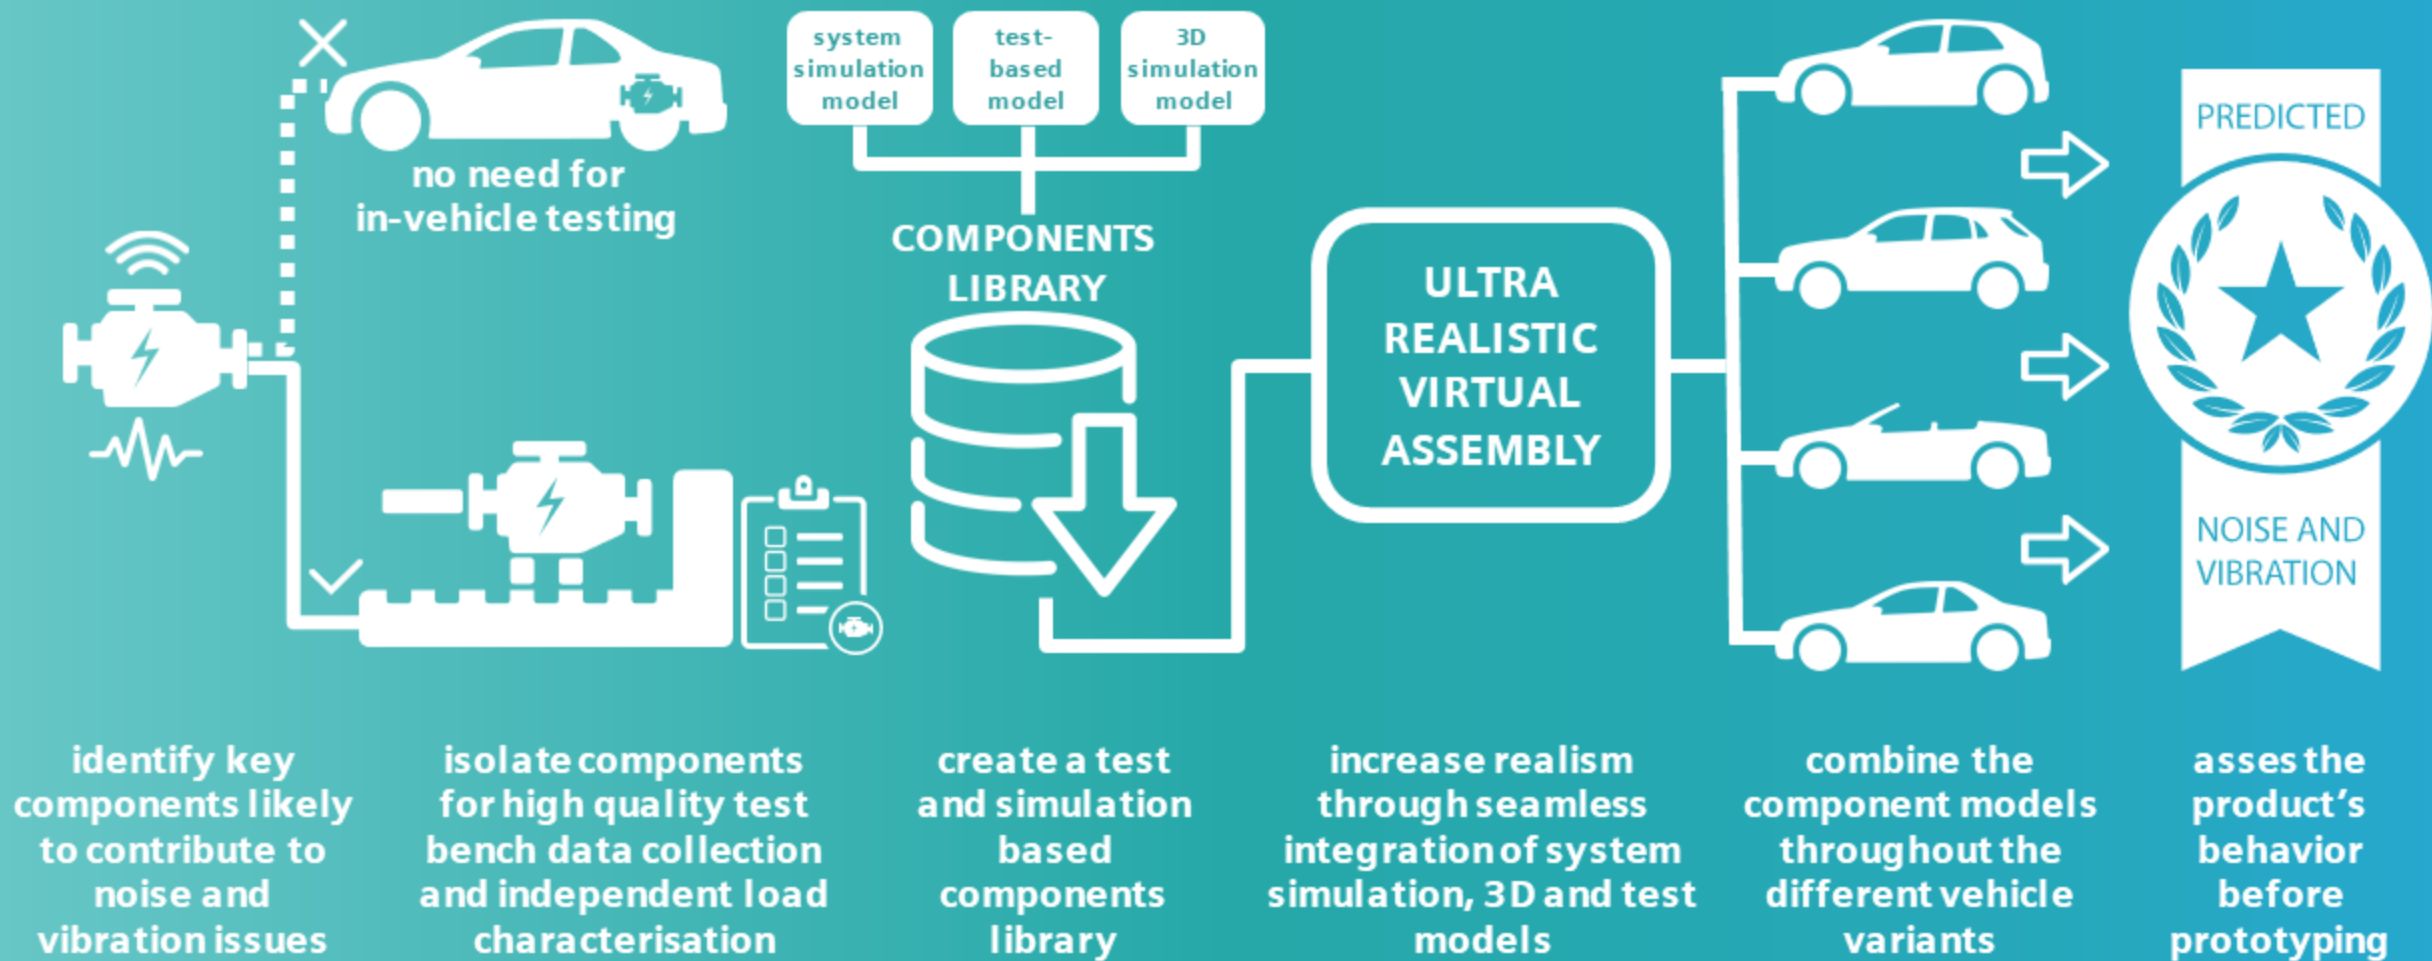

create a test and simulation based components library

Component based TPA

Speeding up the development cycle by combining testing and simulation

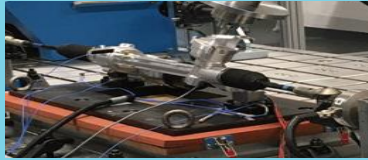

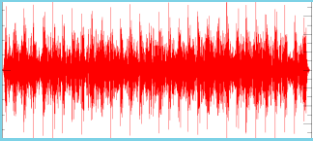

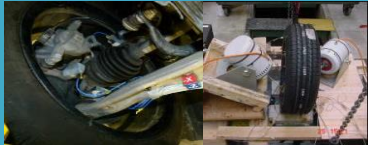

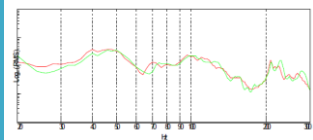

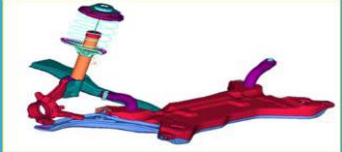

SIEMENS

Ingenuity for life

Component-based TPA

Example applications

Source Mechanism	Invariant Source Synth. Model	Sub-Receiver Connection Elements	Receiver
 <p>Steering System</p>	 <p>Blocked Forces & Impedances Mount Pos.</p>	 <p>Subframe FEM/TEST FRF</p>	 <p>Body FEM/TEST FRF</p>
 <p>Tire Road Noise</p>	 <p>Blocked Forces & Impedances Wheel Center.</p>	 <p>Suspension FEM/TEST FRF</p>	 <p>Body FEM/TEST FRF</p>
 <p>HVAC Compressor</p>	 <p>Blocked Forces & Impedances Connection.</p>	<p>Blocked Force Compressor Local Stiffness Vehicle Local Stiffness Mount to Target FRF</p>  <p>Vehicle FEM/TEST FRF</p>	
 <p>Wiper System</p>	 <p>Blocked Forces & Impedances Connection</p>	 <p>Mounts TEST Stiffness</p>	 <p>Body FEM/TEST FRF</p>
 <p>Gearbox Actuator</p>	 <p>Blocked Forces or Free Accelerations Volume Velocities Impedances</p>	 <p>Vehicle FEM/TEST FRF</p>	

Simcenter Engineering project – Tire supplier

Road noise – Wheel center blocked forces

Identification of blocked forces on test rig

Blocked Forces and Moments

- Source in operation: 20 / 40 / 60 / 80 / 100 kph.
- Blocked forces calculated using in-situ TPA: matrix inversion using multiple integral shakers for FRF
- Blocked forces direct measured on rigid test rig using force cell (usable up to 300 Hz)

On board validation of target response on test rig

- On-board validation
- Identification of path contribution
- Input for realistic target setting & prediction
- Independent of test rig

Development of the world's first NVH steering system bench

- Reduced overall resources to solve NVH-related issues
- Accurately estimated resources for NVH resolution upfront
- Received positive feedback from customers, who appreciate the output data as well as the approach used to gather it

Developing a powerful partnership

- Translate NVH recommendations into real and objective requirements and targets
- Integrate test and simulation to determine and resolve the root causes of problems

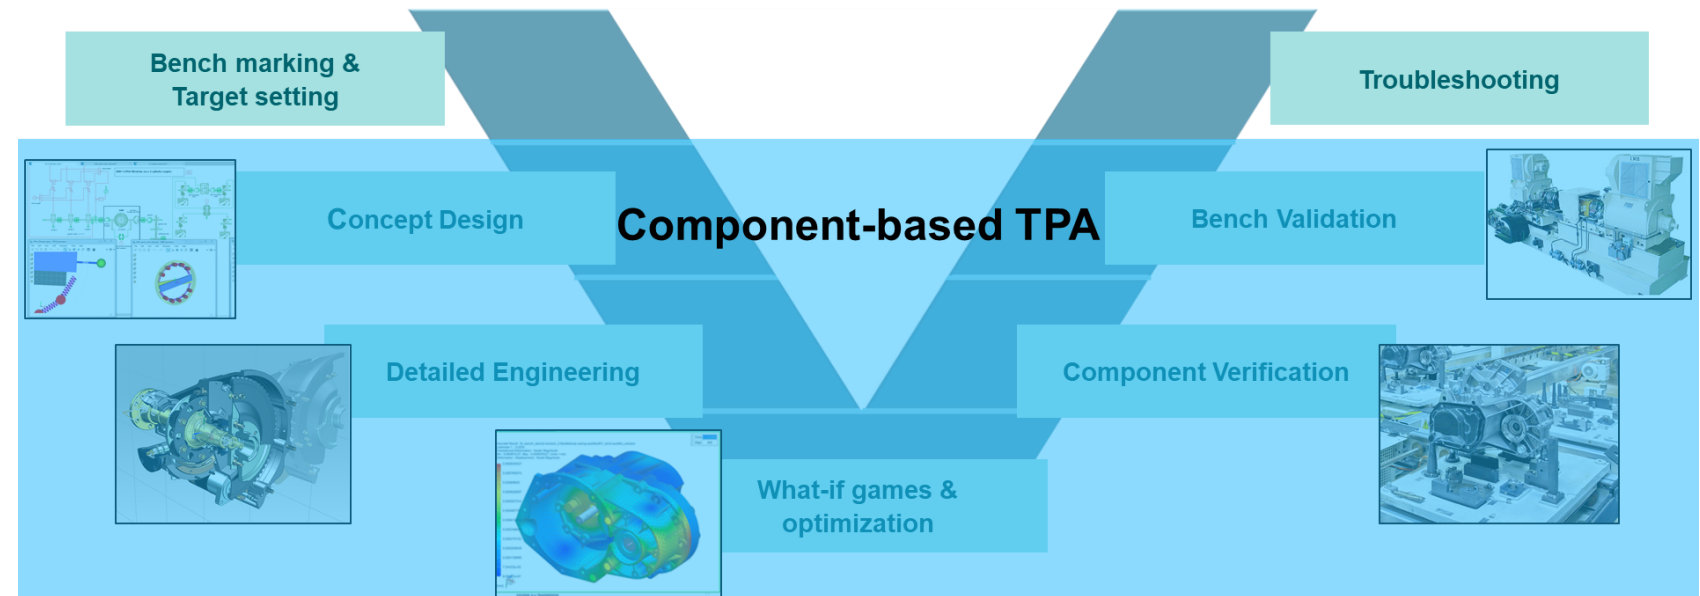

“We can establish exactly how much force we are allowed to introduce to a particular car to stay below a given NVH target, and we find that our customers appreciate this approach a lot.”

Christian Landsberg, Global Chief Engineer NVH

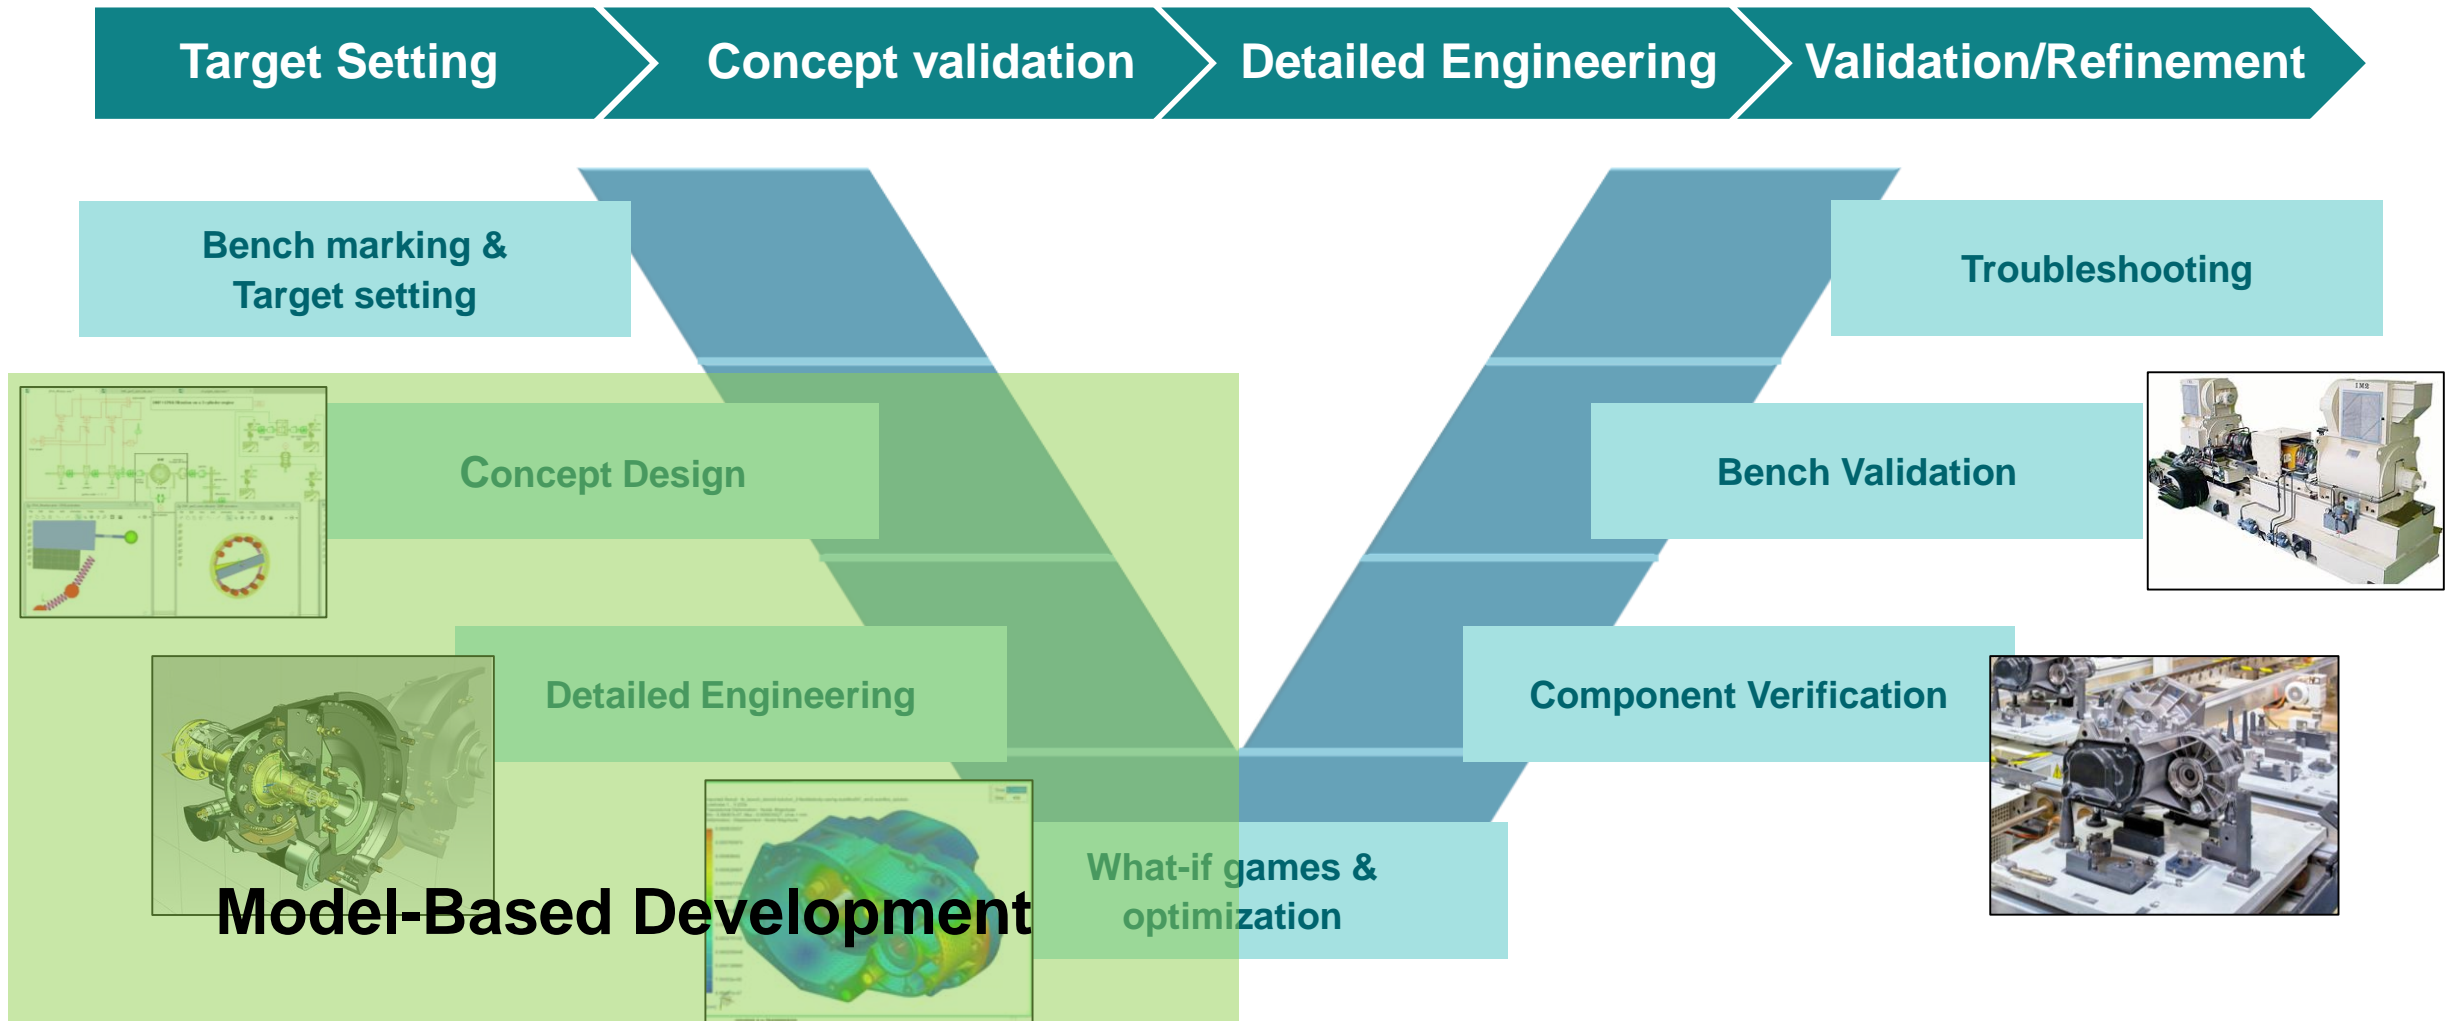

Component-based TPA

Improve OEM cooperation by setting realistic targets on invariant loads

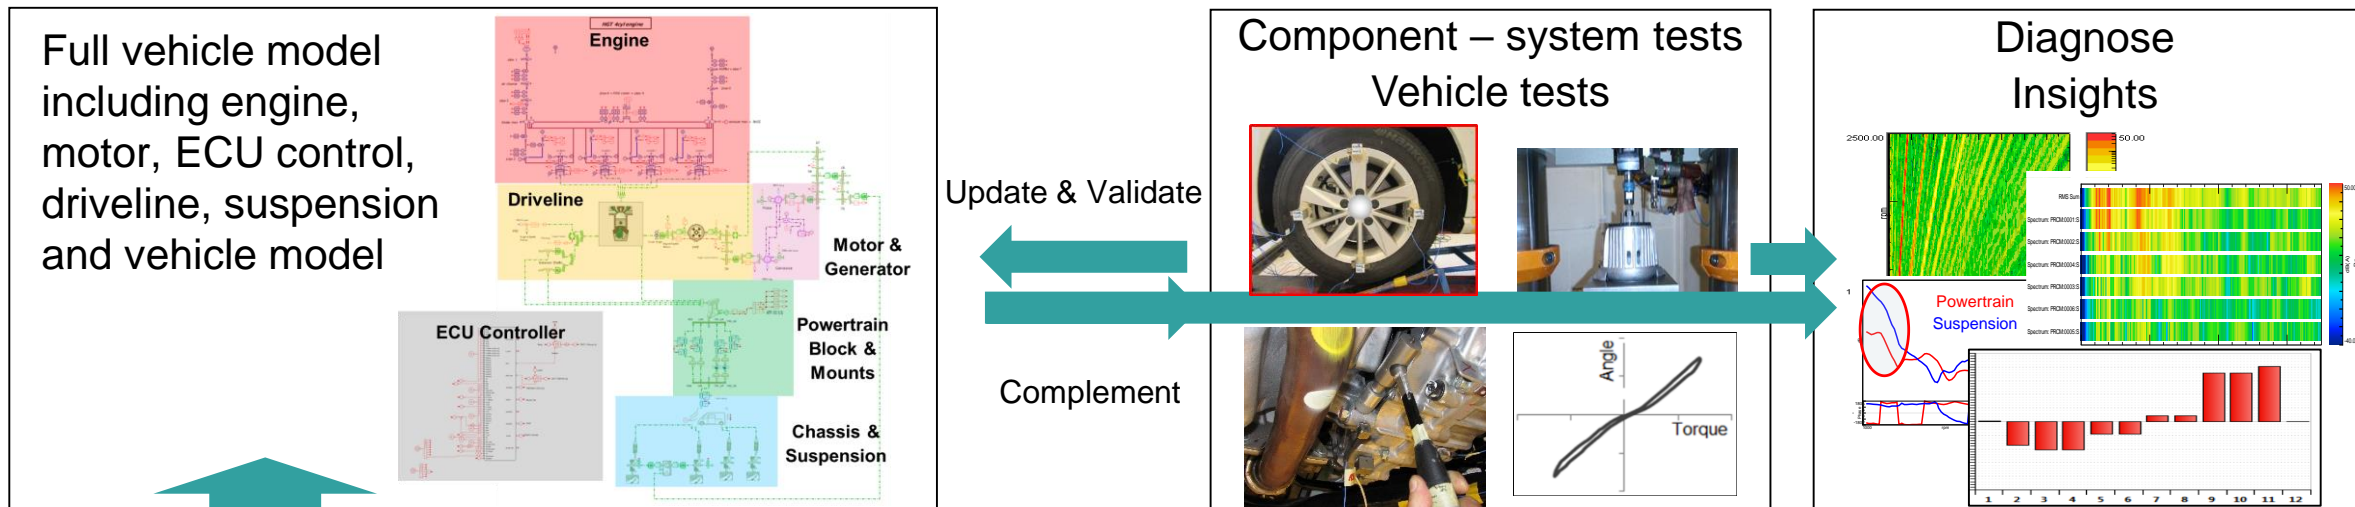

Enhance usage of bench data to create virtual prototype assembly

Ensure vehicle-level component NVH evaluation Throughout the development cycle

Model-based development Process deployment for system engineering

Scalable model complexity
f(accuracy, information)

	Engine	T/M	SUSPENSION	BODY
Master (not to be modeled)	HF engine	All internal details with clearances	3D full physical	FE
Level 1	MVEM	Simple ratio with equivalent inertia	1D	
Level 2	Mapped engine + 3D body	Simple ratio with equivalent inertia and clearance	2D	2D
Level 3	Cylinder pressure tables + 3D body	TM with distributed inertias and stiffness	2D with NVH tire model	2D + FRF

Model-based development

Full vehicle reverse engineering

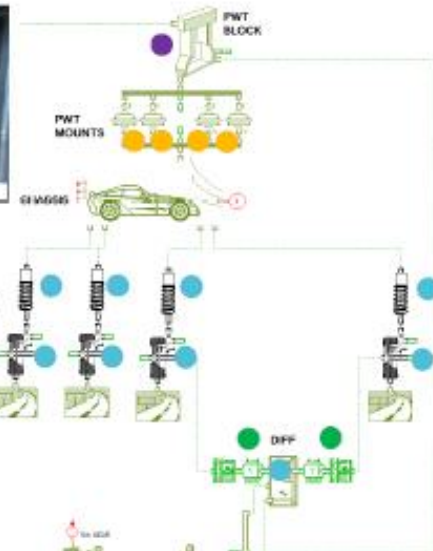

Pendulum bench for rotating part inertia measurement

Dimensions Metrology

PWT mounts characterization

drive shafts characterization

PWT inertia tensor and CoG measurement

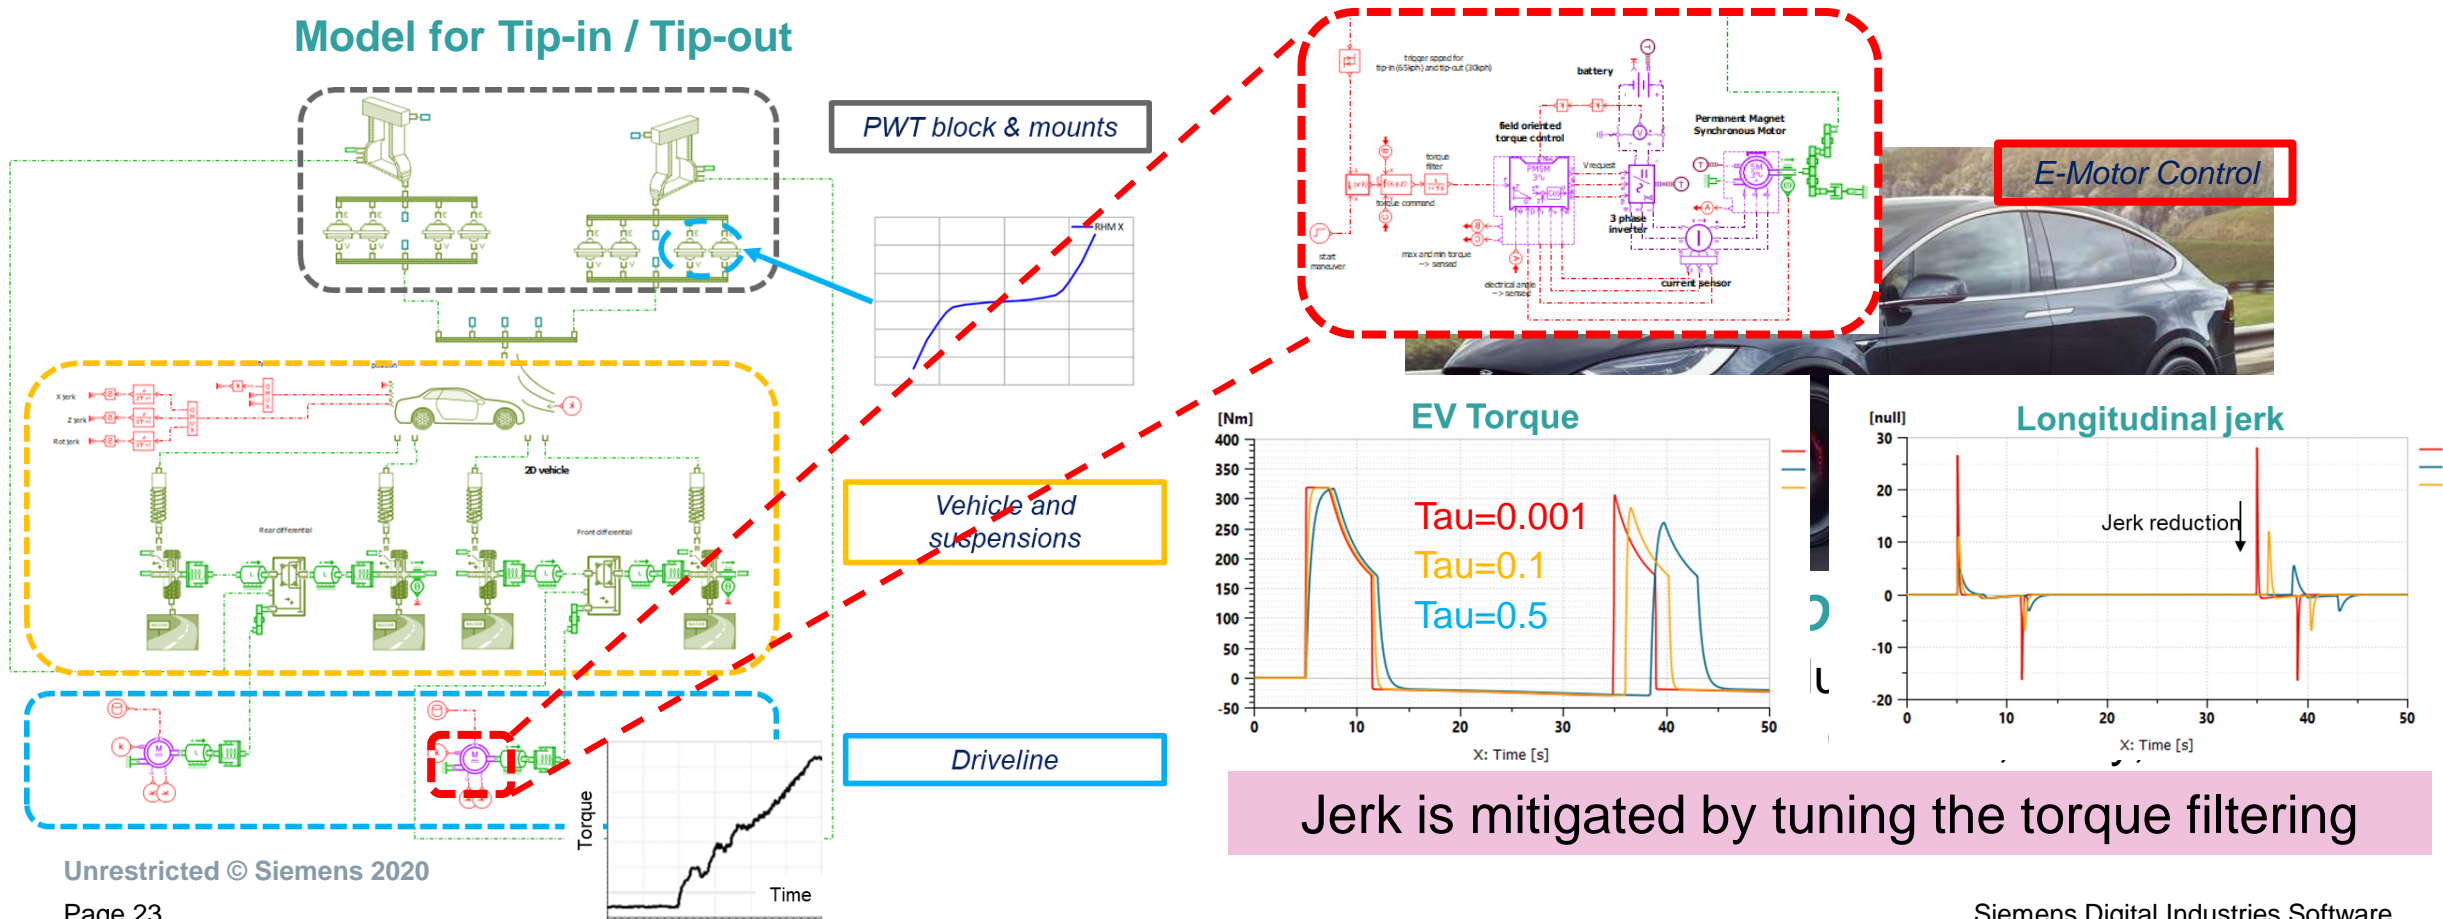

wheel instrumentation for NVH tire characterization

Simcenter Engineering project – Automotive supplier

EV full vehicle modeling for component design evaluation

Target: be able to develop full vehicle system simulation models for early design studies of components such as active suspensions, electro-motors, braking systems.

Model for Tip-in / Tip-out

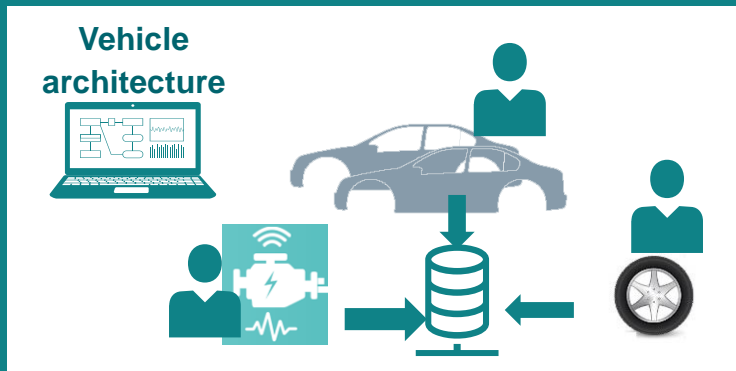

Virtual prototype assembly

Maximized data usage for a wide range of performance predictions

Accurate component models

Publish component data in standardized component libraries

Available for all

Maximize accessibility of component data

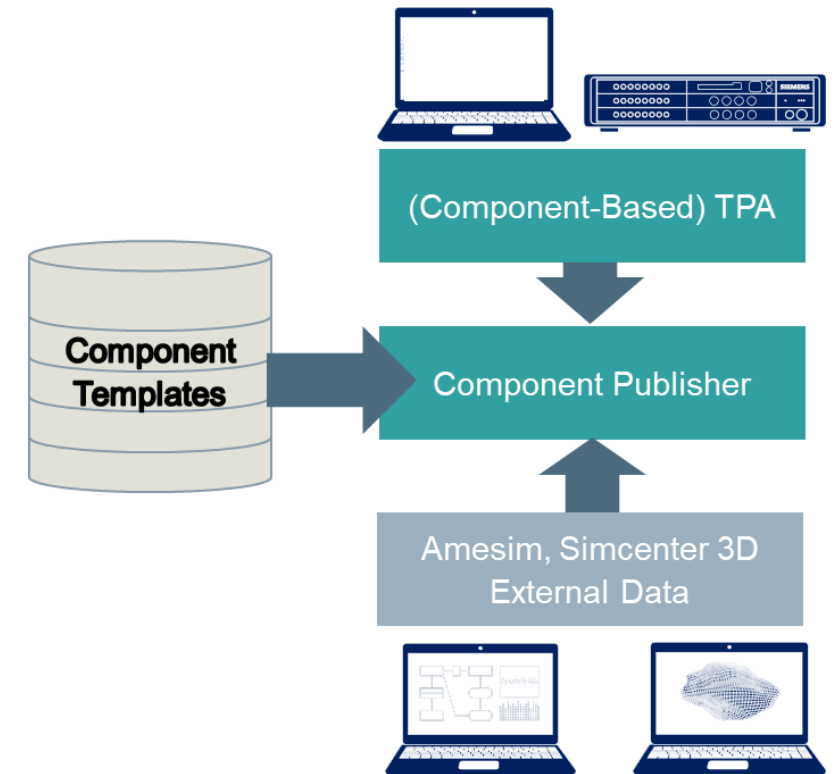

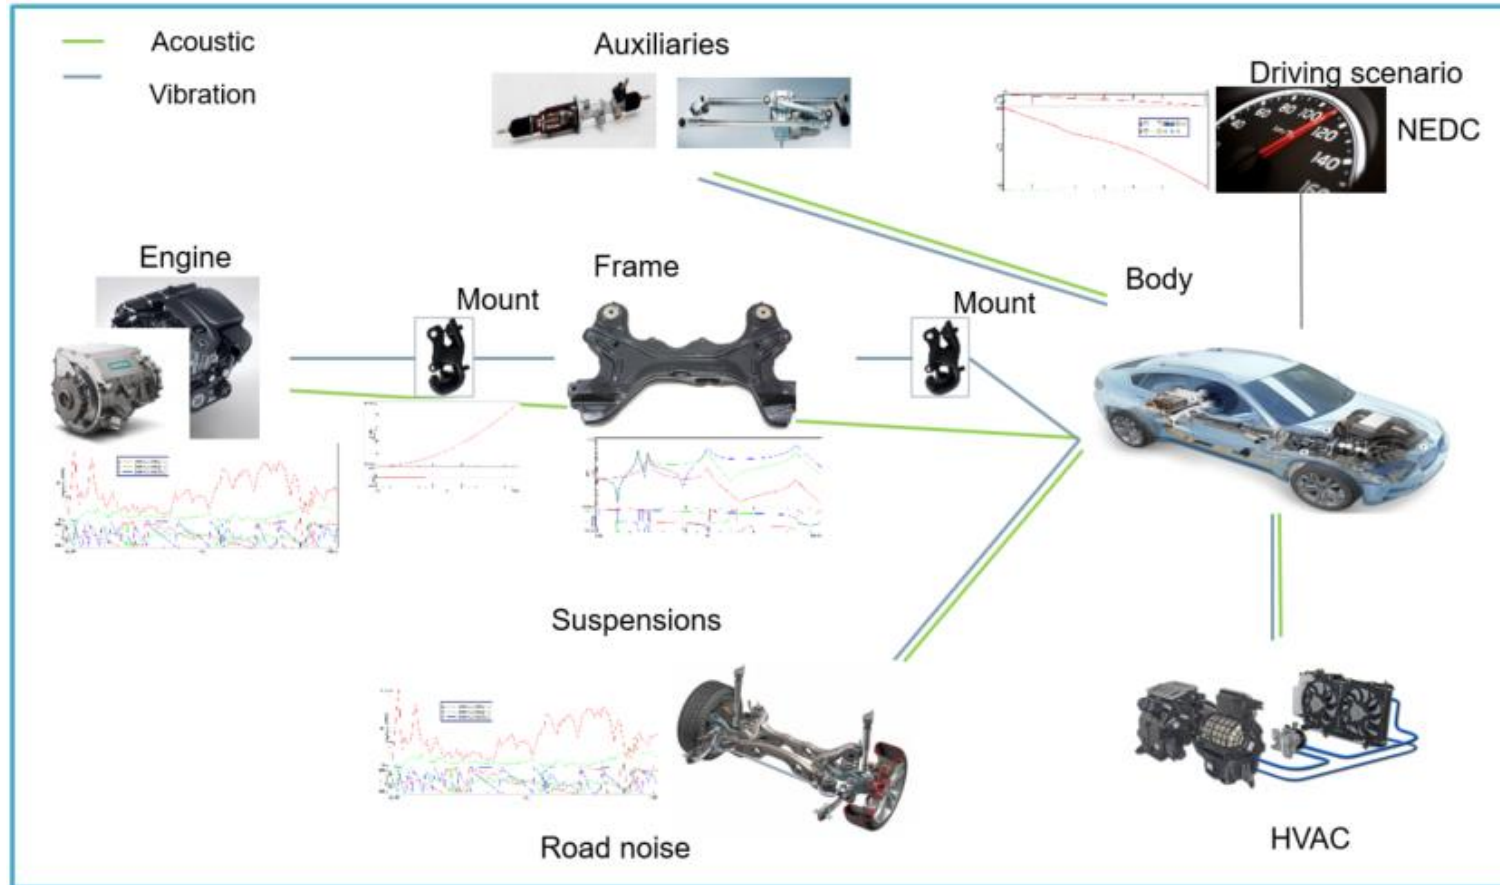

Performance evaluation

Access models by large group for wide range of performance predictions

Virtual prototype assembly

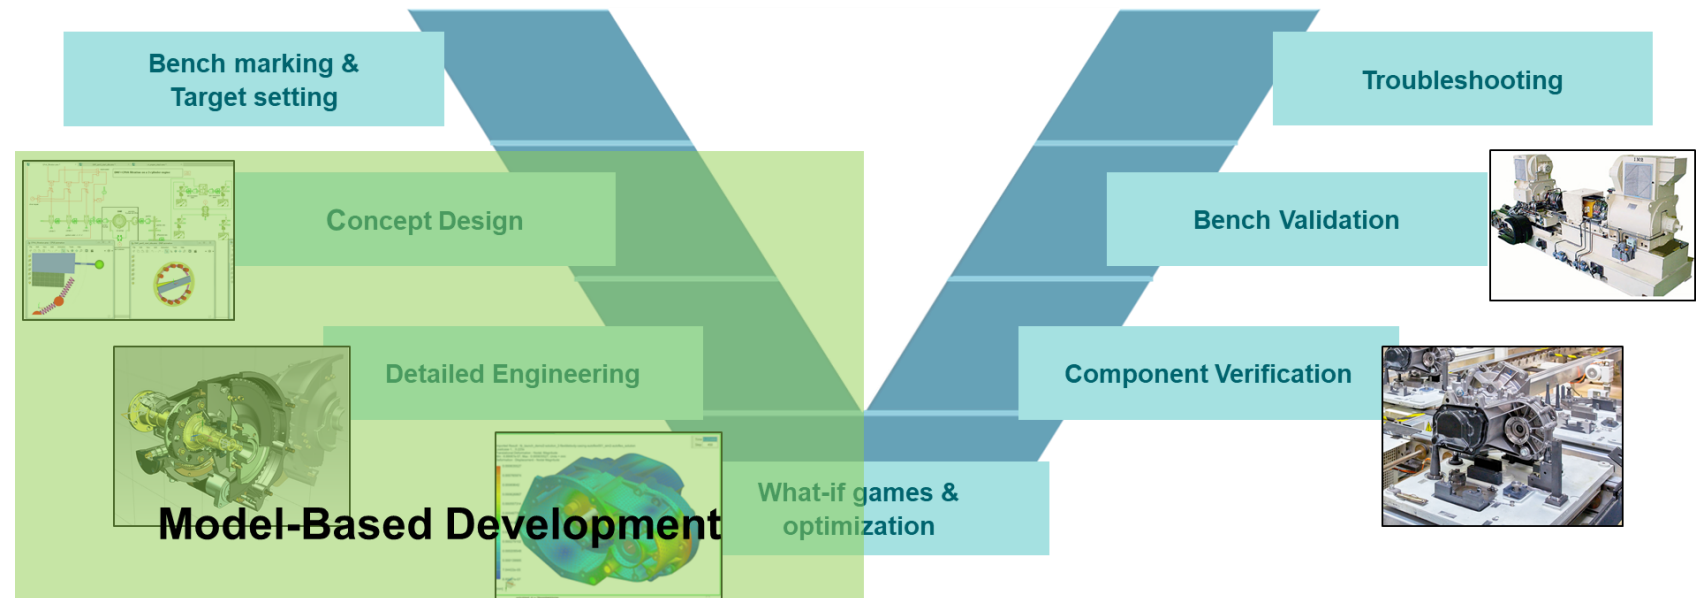

Maximized data usage for a wide range of performance predictions

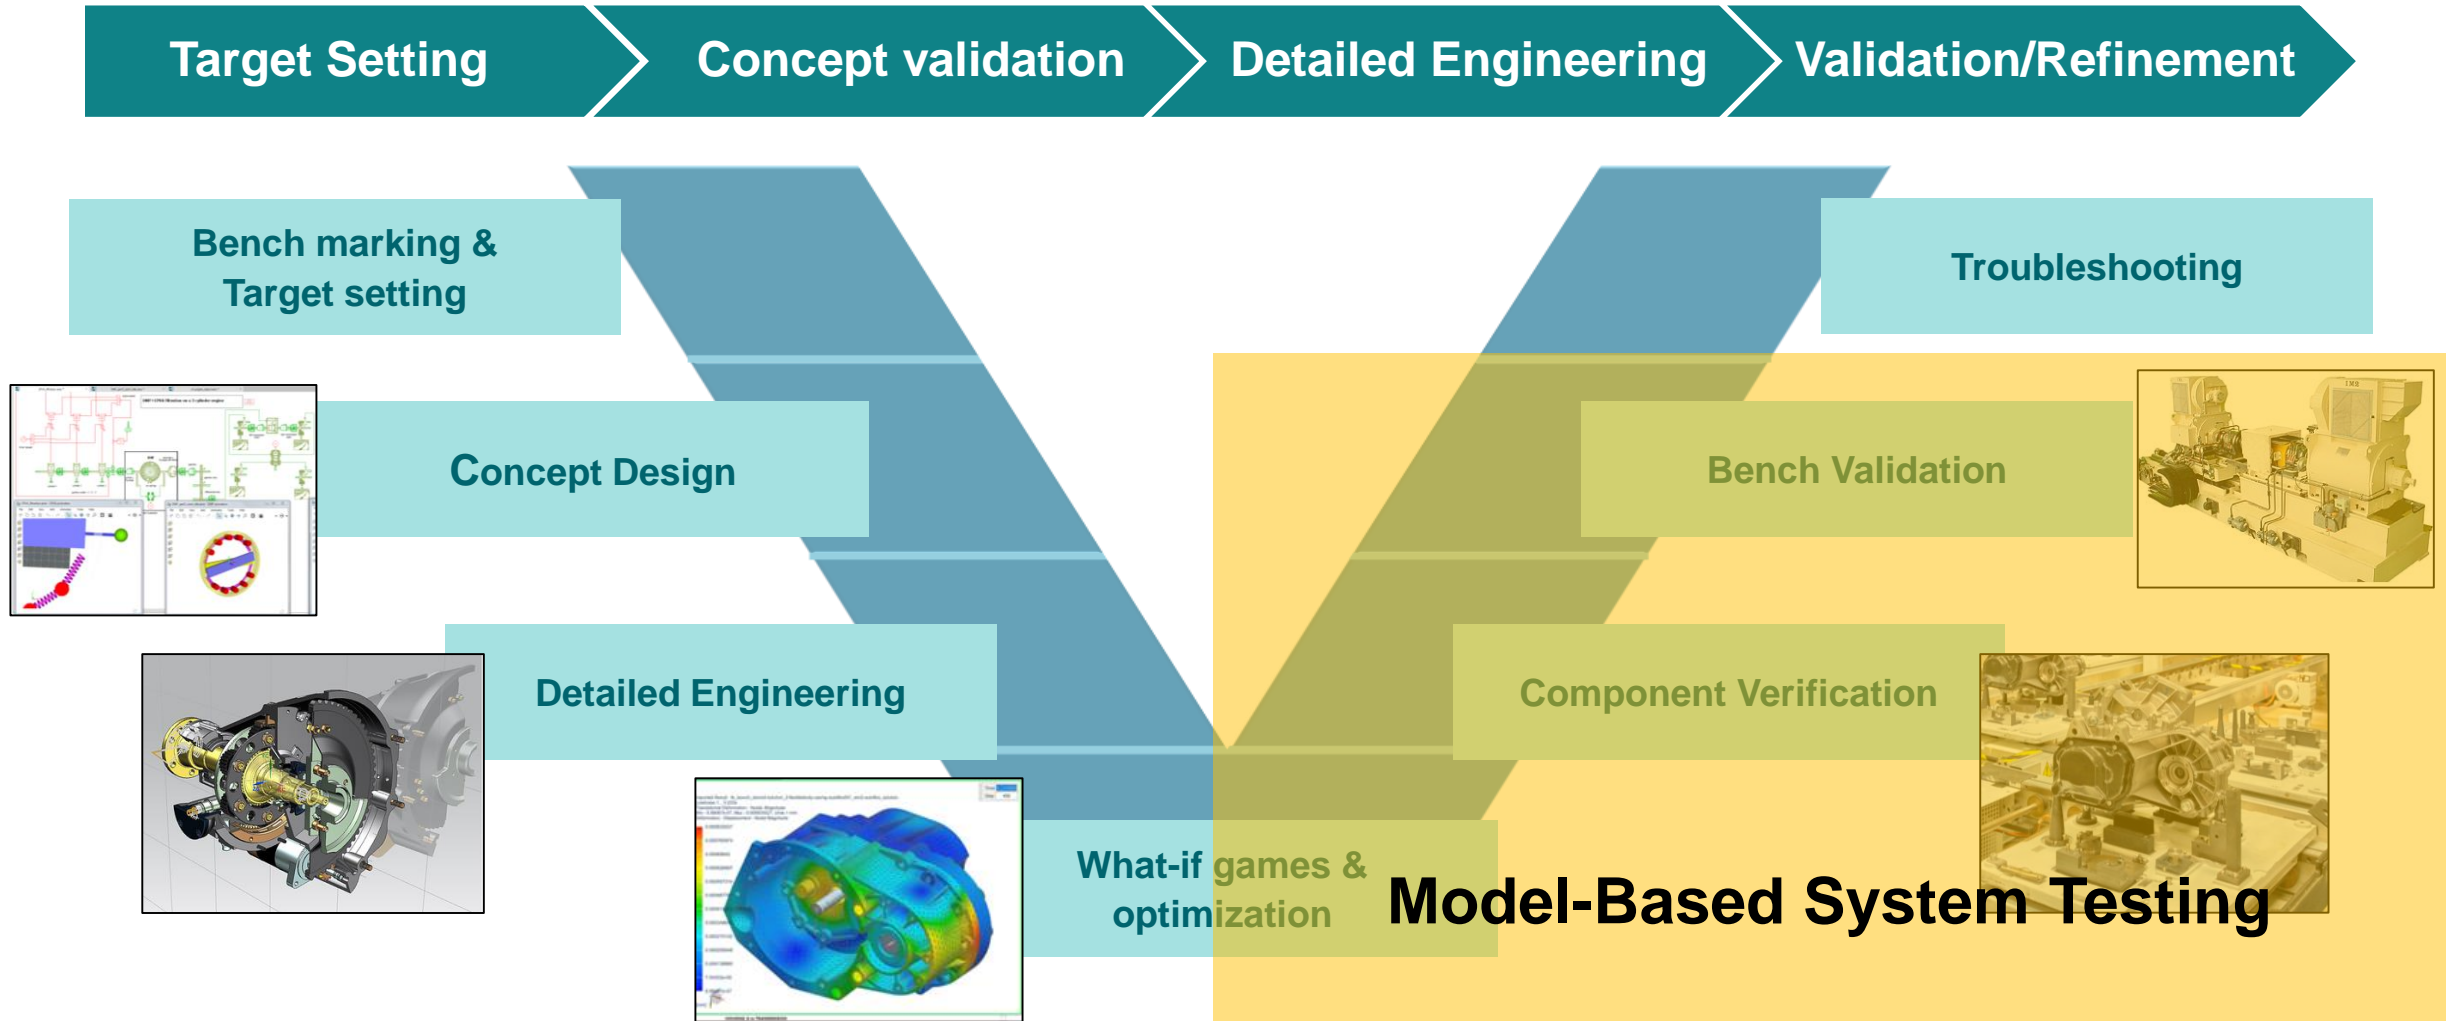

Model-based development

Enable component
concept design with
system simulation

Quick assessment of
many design variants

Ensure vehicle-level component NVH evaluation Throughout the development cycle

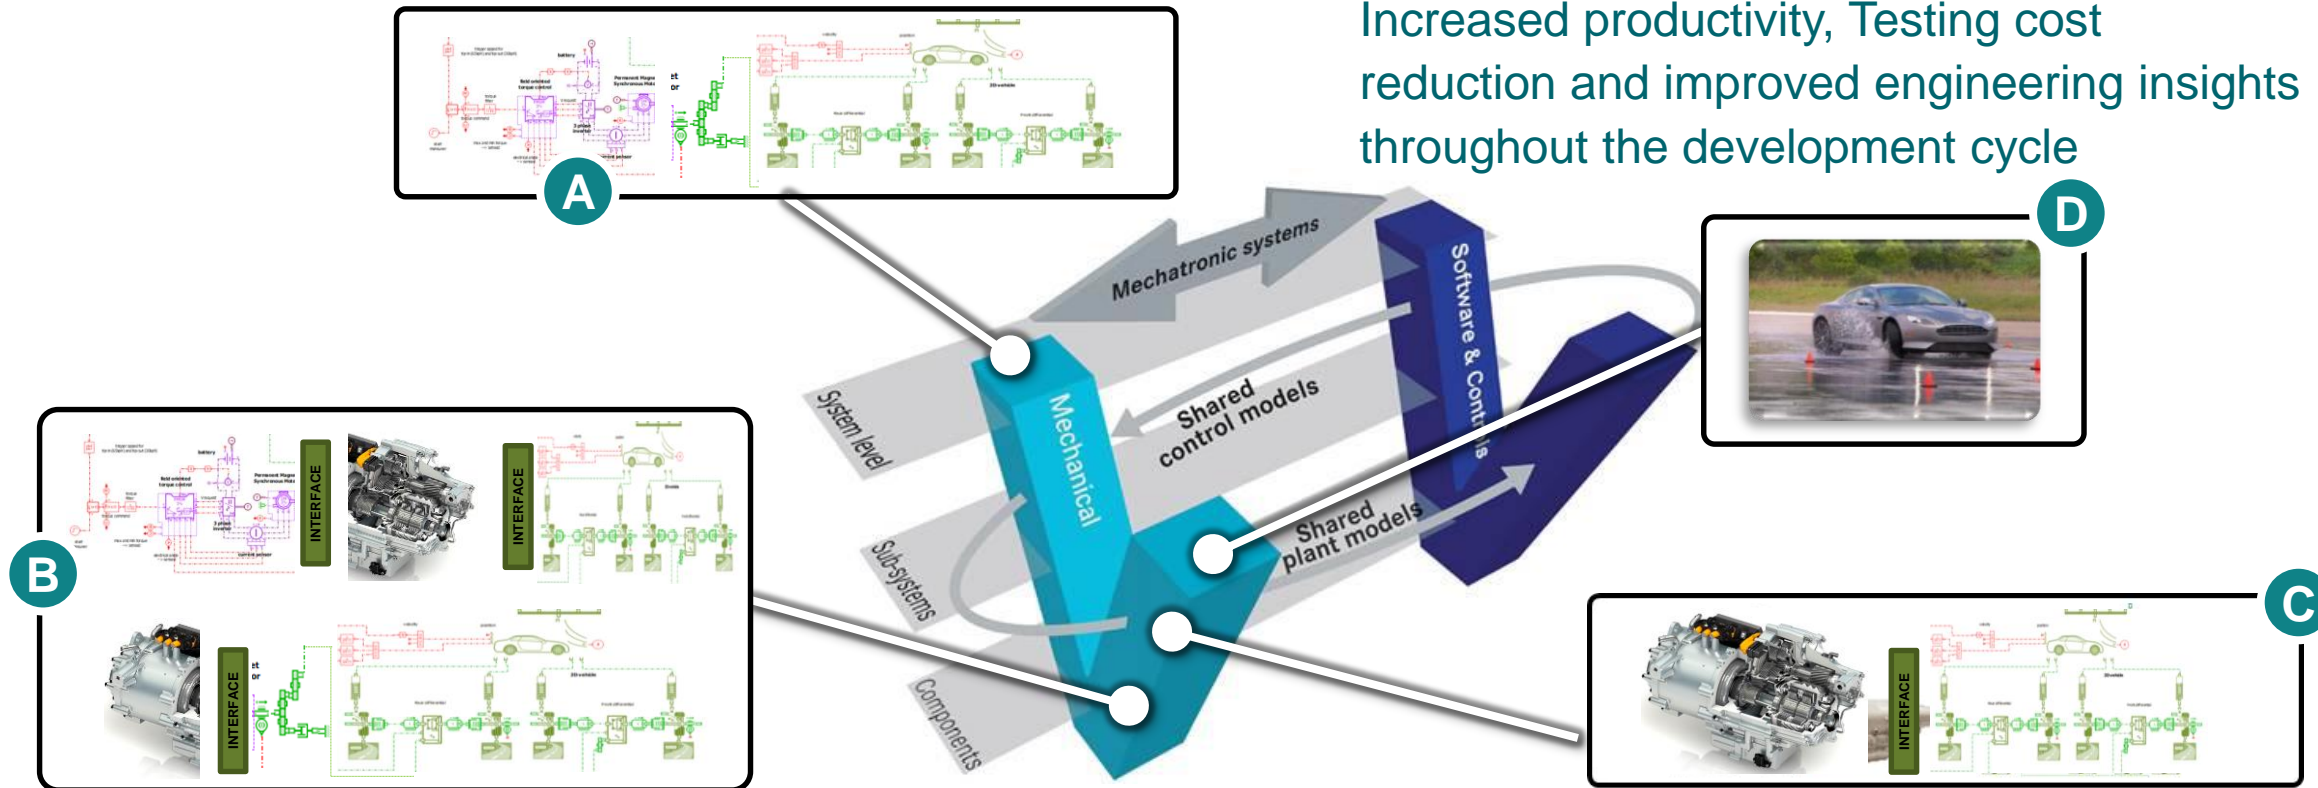

Model-based system testing

Overview

One testing framework ranging from virtual testing to field testing
Providing consistent validation & verification throughout the development

Increased productivity, Testing cost reduction and improved engineering insights throughout the development cycle

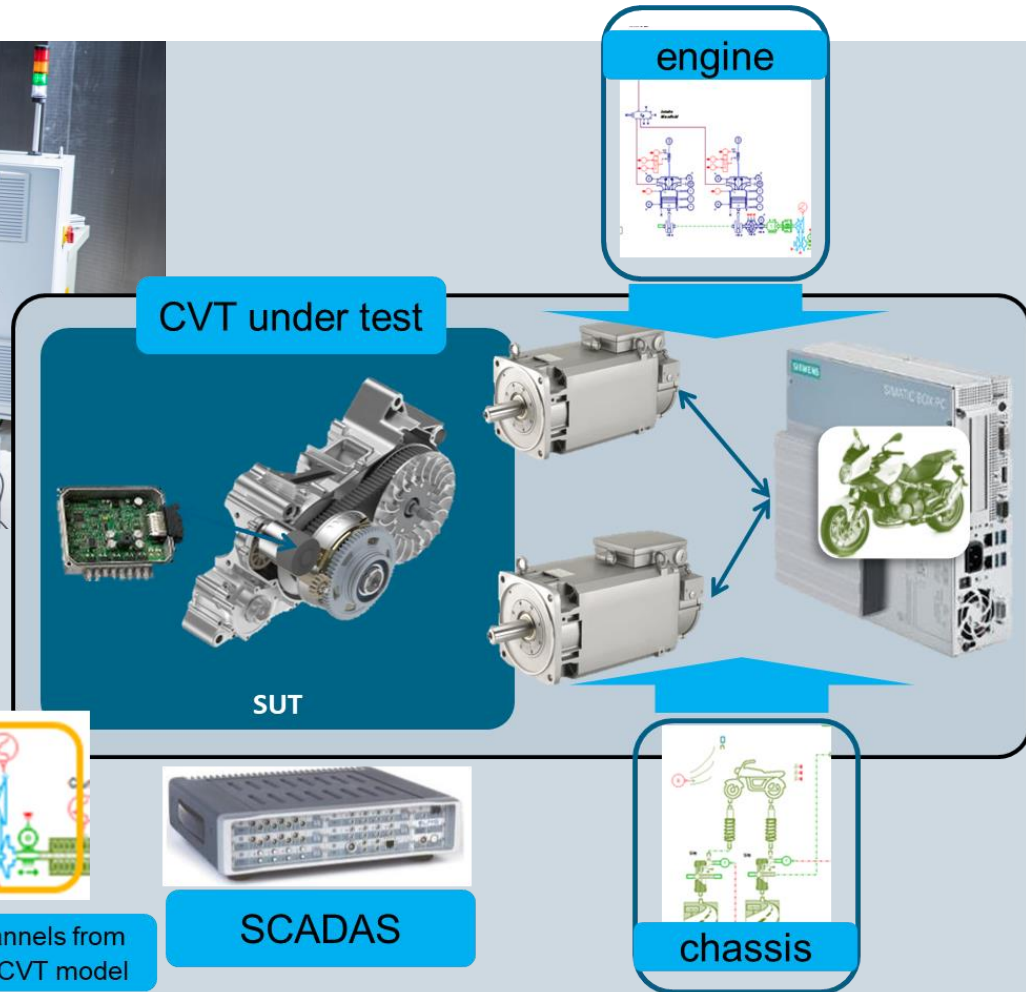

**Simulation based
cascaded design**

**Test based cascaded
verification**

Simcenter Engineering project - Transmission supplier

Motorcycle e-CVT bench

Challenge

Validate transmission design targets for multiple attributes: Life-time, quietness, weight reduction, low friction

Solution

Model of motorcycle engine and chassis providing real-life test conditions

Benefit

- Validate transmission design before full vehicle prototype is available

Simcenter Engineering project - Auto OEM

Torsional bench mechanical design

Motor Torque

Torsional Mode

Bench Model

Challenge

Ensure correct bench operations for component validation tests. Testing conditions may be limited due to bench design (torsional resonances, power)

Solution

Deploy a Digital twin of the bench + component to set requirements (motor size, inertia, stiffness) and ensure the correct loading in all scenarios

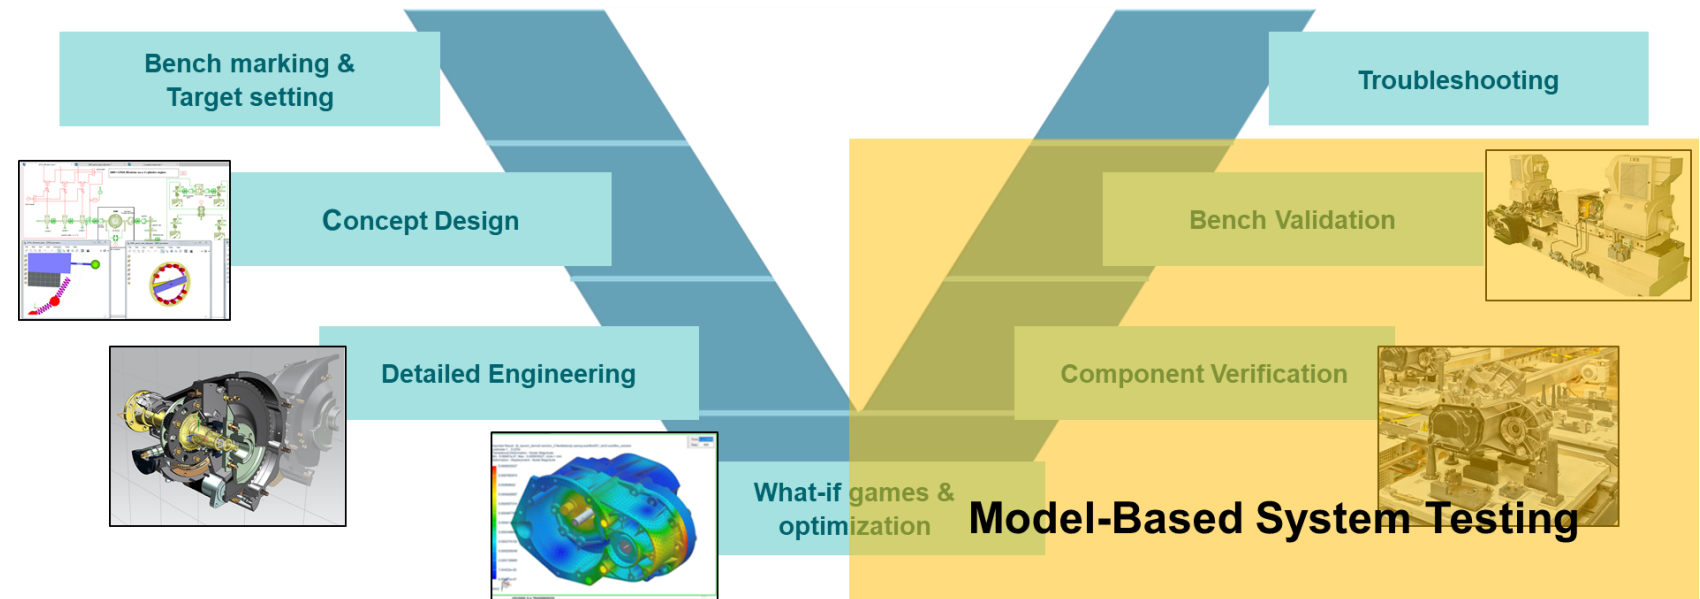

Benefit

- Easily evaluate broad range of variants and combinations
- Study feasibility of test scenarios during concept phase

Model-based system testing

Enable component testing in the lab in real-life conditions

Solve integration issues upfront

Ensure vehicle-level component NVH evaluation Throughout the development cycle

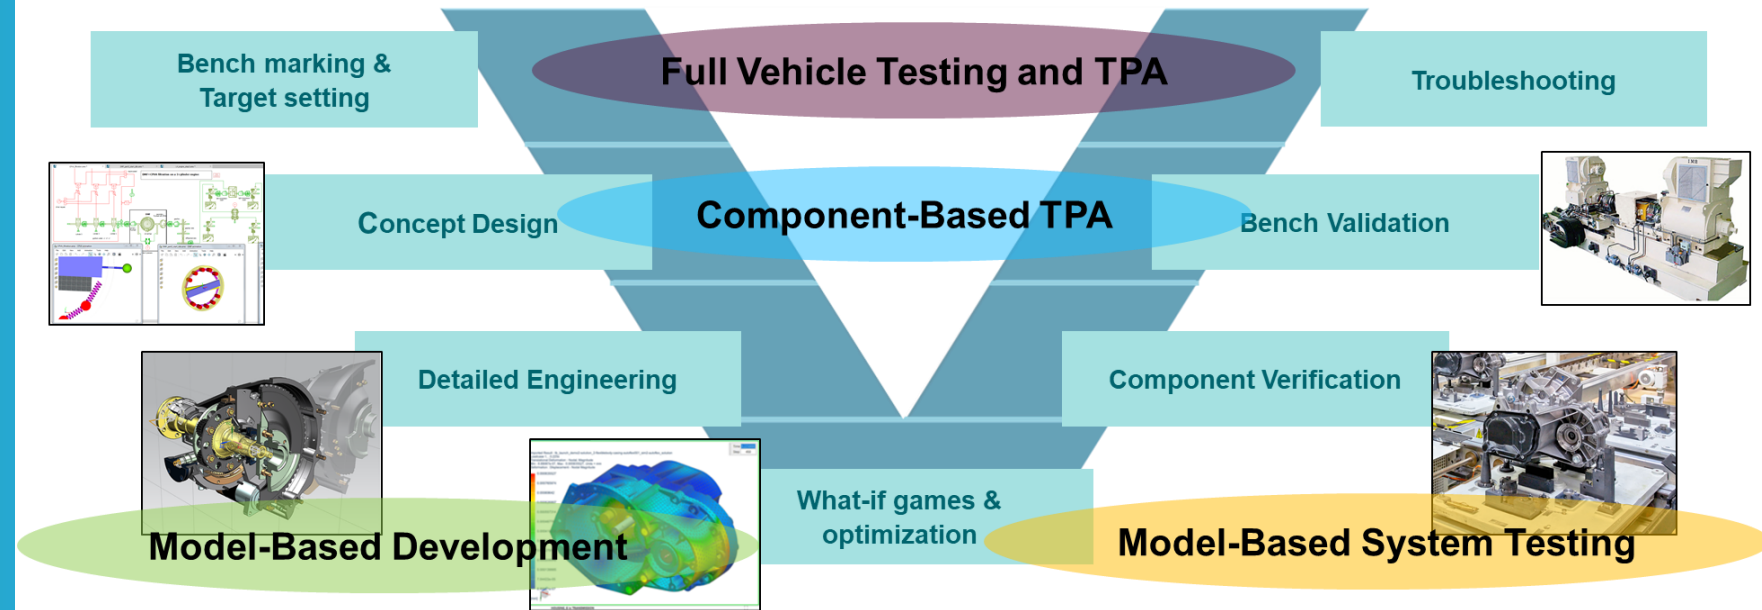

Evaluate the sub-system in Full Vehicle with test and system simulation technologies

Cascade Targets from System to Components with TPA

Improve OEM cooperation by using invariant loads from Component based TPA

Enable component concept design with Model based Development

Solve integration issues upfront with Model Based System Testing
