

Siemens software as a service

Speeding up time-to-value for project initiatives

Benefits

- Accelerate time-to-value for project initiatives
- Reduce software implementation time, costs and risks
- Improve mobility with easier access to software
- Always use the latest version of software
- Enhance scalability with access to services as needed

Summary

Software as a service (SaaS) is a subscription-based software licensing and distribution model in which both the software and the managed data are hosted on external servers. The application is accessed through a web browser and there is no need to buy, install, upgrade or maintain any hardware or software. Siemens Digital Industries Software hosts the software remotely in the cloud and also provides technical support.

Users access SaaS applications and data from any internet-connected computer or mobile device, making it much easier to deploy. There is no need to worry about developing applications that run on different types of computers or devices since Siemens has already done that for you.

Rather than buying new software, which can be costly, time-consuming and unpredictable, customers can rely on Siemens to automatically perform updates and patch management, reducing the burden and overhead expenses

Siemens software as a service

associated with an extensive internal information technology (IT) staff. Furthermore, cloud-based software offers significant vertical scalability, giving customers the flexibility to access services on-demand as needed.

With subscription-based licensing set on a per-user (or per-seat) basis and paid on a scheduled basis, customers can transition software costs from a larger capital expense to more manageable (and more easily approved) recurring operating costs, only paying for what they use.

Siemens manages the infrastructure (hardware and software), operations, upgrades and technical support of the software, helping our customers make the most of their IT budgets and resources. Customized training programs and configurations are always available from Siemens and our partners.

The highly scalable cloud-based applications and services, which are part of the Xcelerator™ portfolio, the comprehensive and integrated portfolio of software and services from Siemens Digital Industries Software, reflect years of industry expertise and include scalable platforms, proven IT infrastructures and established business models to support quick, accurate and secure implementations and continuous customer success.
